INFRASTRUCTURE REPORT CARD OF SPAIN

COMPLETE WATER CYCLE REPORT 2023

August, 2023

INDEX

Acknowledgments.....	4
1. Purpose and scope.....	5
2. Description of Spain's Complete Water Cycle Infrastructure	6
2.1. Upstream water capture infrastructure.....	7
2.2. Water Treatment Infrastructure	7
2.3. Infrastructure for water distribution.....	8
2.4. Sewer Infrastructure in Spain.....	9
2.5. Reuse and Treatment Infrastructure in Spain	9
3. Methodology	11
4. Quantitative Indicators of the Complete Water Cycle	15
4.1. Capacity	18
4.1.1. Capacity Indicators	20
4.1.2. Capacity Indicator.....	27
4.2. Performance	29
4.2.1. Performance Indicators.....	30
4.2.2. Performance Indicator	37
4.3. Financing.....	39
4.3.1. Financing Indicators	40
4.3.2. Financing Indicator	47
4.4. Adaptation to the Future and Sustainability	49
4.4.1. Adaptation to the future and Sustainability Indicators	51
4.4.2. Adaptation to the future and Sustainability Indicator	61
4.5. Operation and Maintenance	63
4.5.1. Operation and maintenance Indicators	64
4.5.2. Operation and Maintenance Indicator.....	67
4.6. Safety.....	69
4.6.1. Safety Indicators.....	70
4.6.2. Safety Indicator	73
4.7. Resilience.....	75
4.7.1. Resilience Indicators.....	76
4.7.2. Resilience Indicator	80
4.8. Engineering and Innovation	81

4.8.1.	Engineering and Innovation Indicators	83
4.8.2.	Engineering and Innovation Indicator.....	99
4.9.	Evaluation of the Complete Water Cycle through objective indicators.....	101
4.10.	Sensitivity analysis based on objective indicators.....	105
4.10.1.	Emphasized weights in Capacity, Performance, and Safety (3); moderate weights in Funding and Adaptation to the future and sustainable development; and Operation and Maintenance (2); low weights in Resilience and Innovation (1)	
	105	
4.10.2.	Emphasized weights in Capacity, Performance, and Safety (2); moderate weights in the rest of the criteria. (1)	106
4.11.	Conclusions from the assessment based on objective indicators.....	107
4.11.1.	Capacity Criterion.....	107
4.11.2.	Performance Criterion.....	108
4.11.3.	Financing Criterion	108
4.11.4.	Adaptation to the Future and Sustainability Criterion.....	110
4.11.5.	Operation and Maintenance Criterion.....	112
4.11.6.	Safety Criterion.....	112
4.11.7.	Resilience Criterion	113
4.11.8.	Engineering and Innovation Criterion	113
5.	Qualitative evaluation. Expert surveys	115
5.1.	Survey for expert evaluation	117
5.1.1.	Capacity	117
5.1.2.	Performance.....	119
5.1.3.	Financing	120
5.1.4.	Adaptation to the Future and Sustainability	122
5.1.5.	Operation and Maintenance	124
5.1.6.	Safety.....	126
5.1.7.	Resilience.....	128
5.1.8.	Engineering and Innovation	129
5.2.	Supplementary Questionnaire	131
5.3.	Evaluation of the Complete Water Cycle by experts.....	135
6.	Global assessment by objective indicators and by experts.....	136

ANNEXES

Annex 1: List of Tables

Annex 2: List of Figures

Annex 3: Acronyms

Annex 4: Bibliography and References

Annex 5: Complete Water Cycle Indicators from Key International Organizations

1. "Report Card for America's Infrastructure." American Society of Civil Engineers (ASCE)
2. "The Global Competitiveness Report (GCI)." World Economic Forum (WEF)
3. "The Global Adaptation Index (ND-Gain Indicators)." University of Notre Dame (USA)
4. "Transport in the European Union." European Commission.

Annex 6: Complete Water Cycle Indicators from Major Spanish Organizations

Acknowledgments

Asociación Caminos would like to express its gratitude to all the individuals involved in the creation of this report for their professionalism and dedication. Without all of them, it would not have been possible to achieve the quality of content and conclusions presented in this report.

The professionals who have comprised the team are as follows:

- Project Director: José María Izard
- Project Director Support: Oumaima Naima and Estefanía Ramírez
- General Coordinator: Jesús Contreras
- Management Coordinator: Álvaro Díez
- Sector Coordinator: Israel Sánchez - Palomo

We would also like to extend our gratitude to the experts that worked on the qualitative evaluation.

Furthermore, we have had the support and trust of various sponsors, whom we also thank for their contribution to the completion of this report. These companies include: Acciona, Adiante, ASCE, Cyopsa, Grusamar, and TYPSA.

1. Purpose and scope

The purpose of this report is to assess the infrastructure related to the Complete Water Cycle in Spain, following the methodology established by the Spanish Association of Civil Engineers (Asociación de Ingenieros de Caminos, Canales y Puertos y de la Ingeniería Civil, also **Asociación Caminos**). For its elaboration, support has been provided by institutions and organizations linked to the Complete Water Cycle, as well as the expertise of engineers, technicians, and experts who have collaborated with Asociación Caminos.

This document is part of a broader study that analyzes the state of six sectors of public works in Spain: Railways, Highways, Ports, Airports, the Complete Water Cycle, and Urban and Metropolitan Public Transportation. The methodology includes an objective evaluation, based on the analysis of quantitative indicators from both Spain and other selected countries in our economic environment, referenced to the most representative data of each sector in an international context. It also includes a qualitative evaluation of public works in Spain, based on the opinions of a selected group of experts for each sector.

The report is complemented with several Annexes:

- **Annex 1: List of tables.** Complete list of the report's tables.
- **Annex 2: List of figures.** Complete list of the report's figures.
- **Annex 3: Acronyms.**
- **Annex 4: Bibliography and references.** Details the bibliography used and the databases and publicly available documents considered and consulted in this report.
- **Annex 5: Indicators from major international organizations.** Includes detailed information about the evaluations, indices, and indicators from the main organizations that assess infrastructures.
 - “Report Card for America’s infrastructure.” American Society of Civil Engineers (ASCE)
 - “The Global Competitiveness Report (GCI)”. World Economic Forum (WEF)
 - “The Global Adaptation Index (ND-Gain Indicators)”. University of Notre Dame (EE.UU.)
 - “Transport in the European Union”. European Commission.
- **Annex 6: Indicators from the main Spanish organizations,** which includes information about the indicators from the main Spanish organizations:
- **Annex 7: Basic data and details of the indicators used for the quantitative evaluation.**

2. Description of Spain's Complete Water Cycle Infrastructure

In Spain, water is a public resource and its regulation falls under the jurisdiction of various public administrations. Water management is highly heterogeneous, involving both state and regional administrations, as well as independent municipal regulators and numerous private operating entities. Competences are widely distributed and, in many cases, lack coordination among different operators. Water supply management is divided among the public sector (35%), the private sector (33%), mixed public-private management (22%), and municipal management (10%).

The following diagram schematically represents the Complete Water Cycle and the interactions between the various entities.

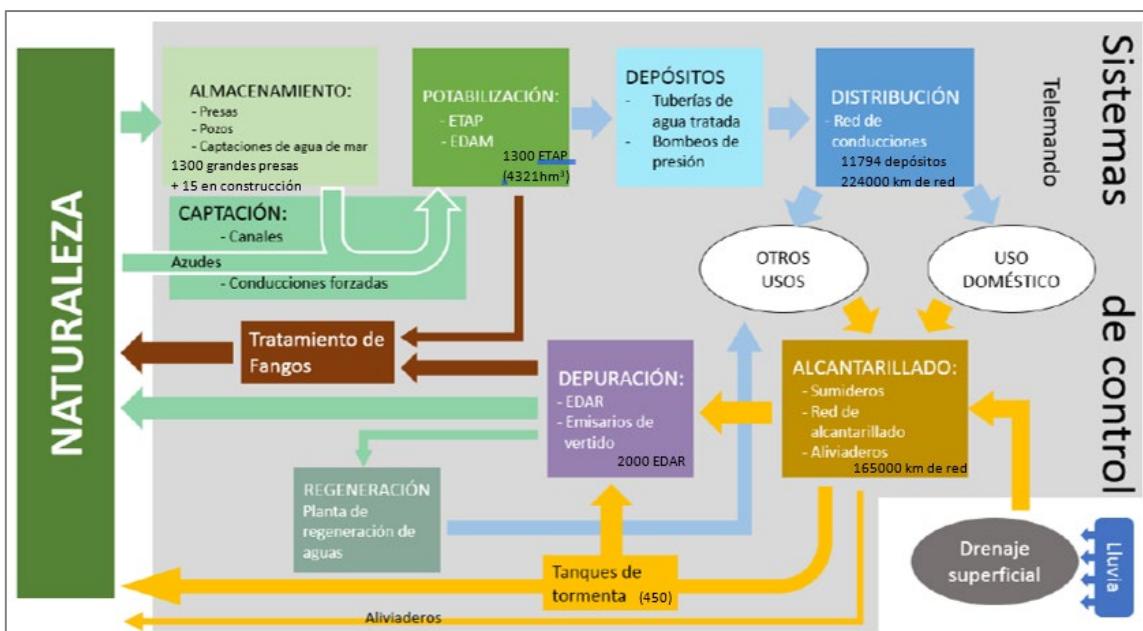

Figure 1: Diagram of the Water Cycle in Spain (AEAS)

The urban water cycle sector represents 0.64% of the GDP, with a turnover of 7.65 billion euros. The sector provides direct employment to 33,000 individuals, with highly qualified training. According to AEAS data, as reflected in their 17th National Study on Drinking Water Supply and Sanitation in Spain 2022, based on sector data from the year 2020, the average price of domestic water is 1.97 €/m³, one of the lowest in Europe, and it constitutes an average of 0.9% of Spanish households' expenditure.

The average household consumption is 131 liters per day per inhabitant. The highest percentage of urban water consumption is for domestic use (67.4%), followed by industrial and commercial use (11.9%), while the remainder (20.7%) is allocated for other purposes.

In Spain, there are 1,640 Drinking Water Treatment Plants (ETAP). The volume of water supplied to the systems is 4,057 Hm³, where there are 29,305 storage tanks, equivalent to 245 liters per inhabitant per day for all uses. This has increased for the first time since 2007, likely due to the rise in losses in the distribution network, which spans 248,245 km. El sistema de alcantarillado tiene aproximadamente unos 190.000 km, con más de 2.232 estaciones depuradoras de WATER (EDAR) que tratan un total de 4.066 hm³, unos 245 litros de WATER depurada por habitante y día.

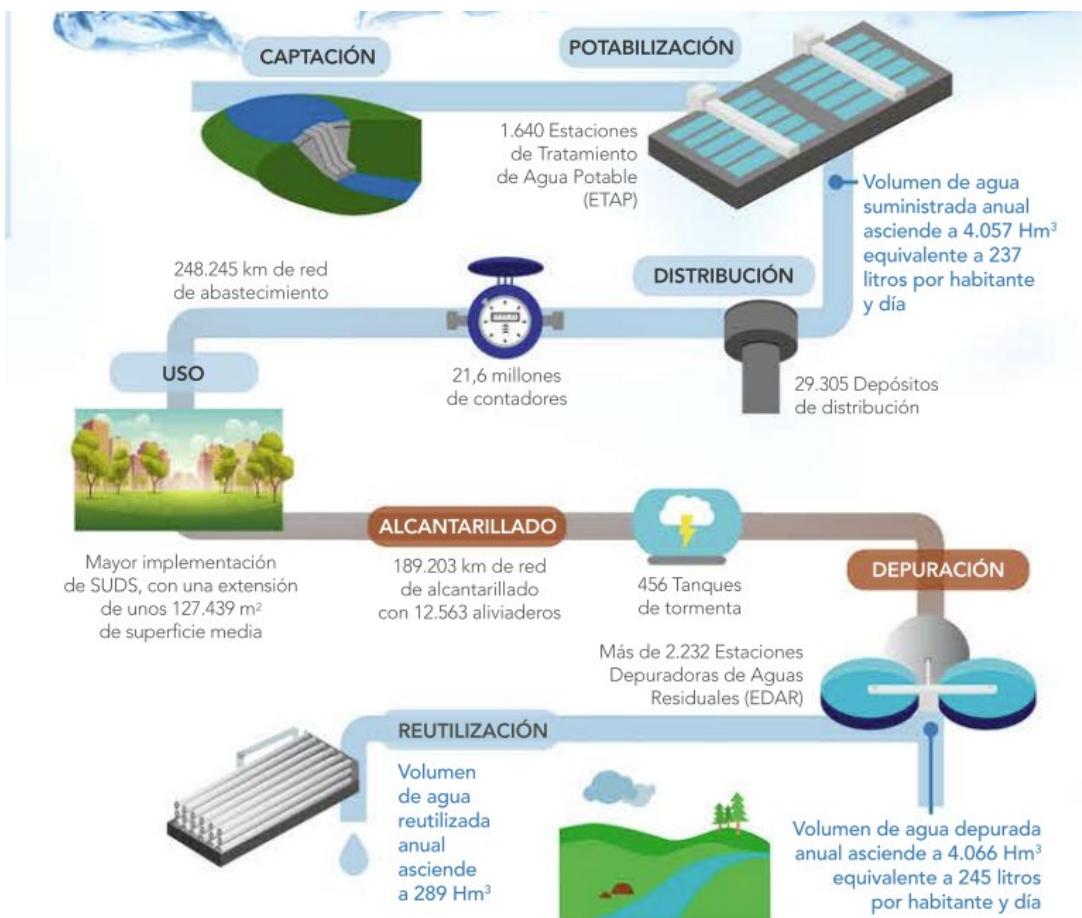

Figure 2: The figures for the Complete Water Cycle (AEAS)

2.1. Upstream water capture infrastructure

In Spain, 65% of the water collected for water supply comes from surface runoff, stored in about 1,300 large dams; 26% comes from groundwater sources, and the remaining 9% is obtained from desalinated water (Spain ranks fifth in the world in terms of the number of desalination plants, totaling 900 facilities with a capacity of 1.45 million cubic meters per day). In recent years, a decrease in the quality of the captured water at its source has been observed. However, water intended for human consumption undergoes rigorous monitoring by operators and health authorities and is of good quality.

Furthermore, the sector continues to make significant efforts to proactively manage risks. Thus, 78% of water supplies have implemented Water Sanitary Plans, and 10% are in progress, in accordance with the future requirements of the European Drinking Water Directive, which is expected to come into effect in 2023. Implementation reaches 95% in metropolitan areas.

2.2. Water Treatment Infrastructure

Spain has around 1,640 Drinking Water Treatment Plants (DWTPs) with a capacity of over 4,000 hm³.

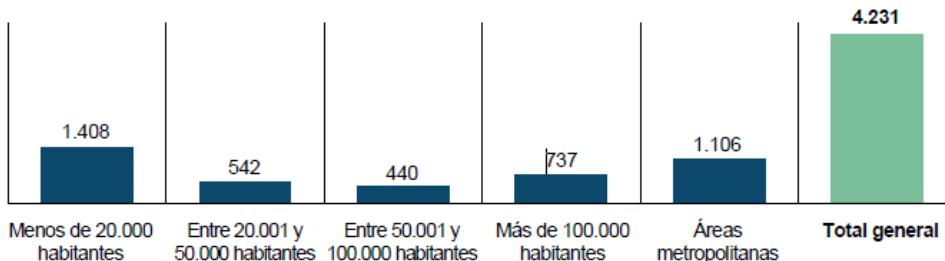

Figure 3: Purified water supplied to the network according to the size of population centers (AEAS)

2.3. Infrastructure for water distribution

The water distribution networks in Spain encompass a total of 248,000 km of pipelines (equating to 4.8 meters of pipe per inhabitant).

Upon analyzing the materials employed in the network's composition, it becomes evident that polyethylene is the most extensively utilized material (constituting 34% of usage), followed by ductile iron (at 32%) and asbestos cement (comprising 20%).

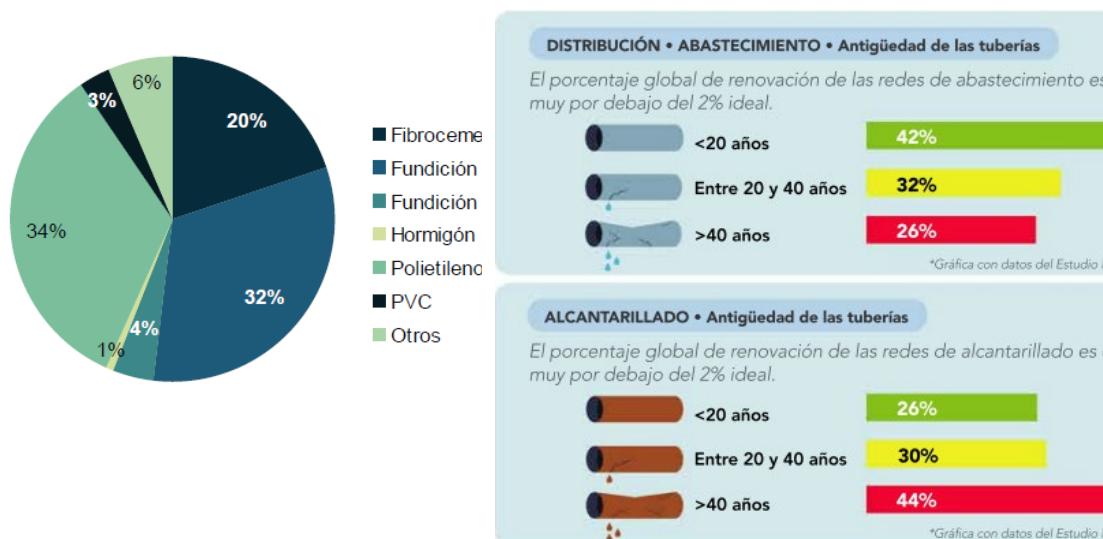

Figure 4: Percentage distribution of materials used in drinking water distribution pipelines in Spanish networks and age of conduits (AEAS)

The study conducted by AEAS-AGA shows that there has been a noticeable aging of these installations, as only 26% are less than 20 years old, 30% are between 20-40 years old, and the remaining 44% are over 40 years old, with a renewal percentage that reaches alarming levels of 0.2%.

In the supply of water to cities and industries, one of the main problems is the losses in distribution networks; it is estimated to account for about 50% to 70% of the extracted water. This significant loss is mainly due to evaporation and, especially, leaks in the network. According to some experts, with proper management, these losses could be reduced to around 15%.

The water meter fleet is of great significance (21.6 million), with 24% of them being less than 5 years old, 40% between 5 and 10 years old, and 36% over 10 years old. The renewal rate is 7%.

In some Autonomous Communities (CC.AA.) such as Andalusia, Aragon, Basque Country, Madrid, or Navarre, the proportion of public participation in water supply management is greater than 50%. On the other hand, in Catalonia, Canary Islands, Murcia, and the Valencian Community, water supply management is predominantly private or mixed.

2.4. Sewer Infrastructure in Spain

In Spain, 76% of sewage networks are combined: stormwater and wastewater flow through the same conduit, while the remaining 24% have separate networks. Efforts are being made to establish separate networks wherever possible to treat only urban wastewater.

Among the materials used in the sewage network, concrete stands out with 56% of the total network, followed by PVC with 24%.

There is a gradual aging of the sewage networks, which currently total 189,200 km of pipes, or 4 meters of pipe per person, with a renewal rate of 0.6%.

2.5. Reuse and Treatment Infrastructure in Spain

In the year 2020, Spain had a total of 2,232 Wastewater Treatment Plants (WWTPs), which treated a combined volume of 4,066 hm³ of wastewater.

The percentage of wastewater reuse across different Autonomous Communities varies significantly, as depicted in the following figure:

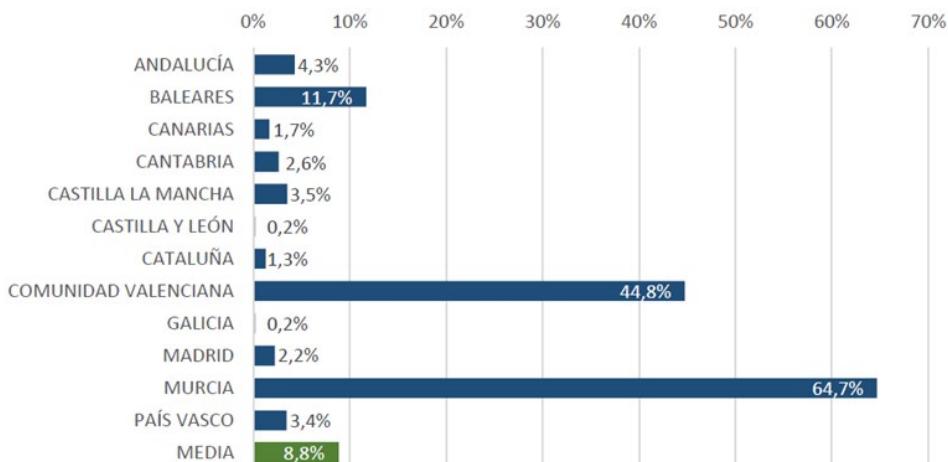

Figure 5: Percentage of wastewater reused out of the total supplied by Autonomous Communities (AEAS)

The European Union has developed a Circular Economy strategy to combat climate change. Water supply and sanitation operators are engaged in this strategy to enhance waste management:

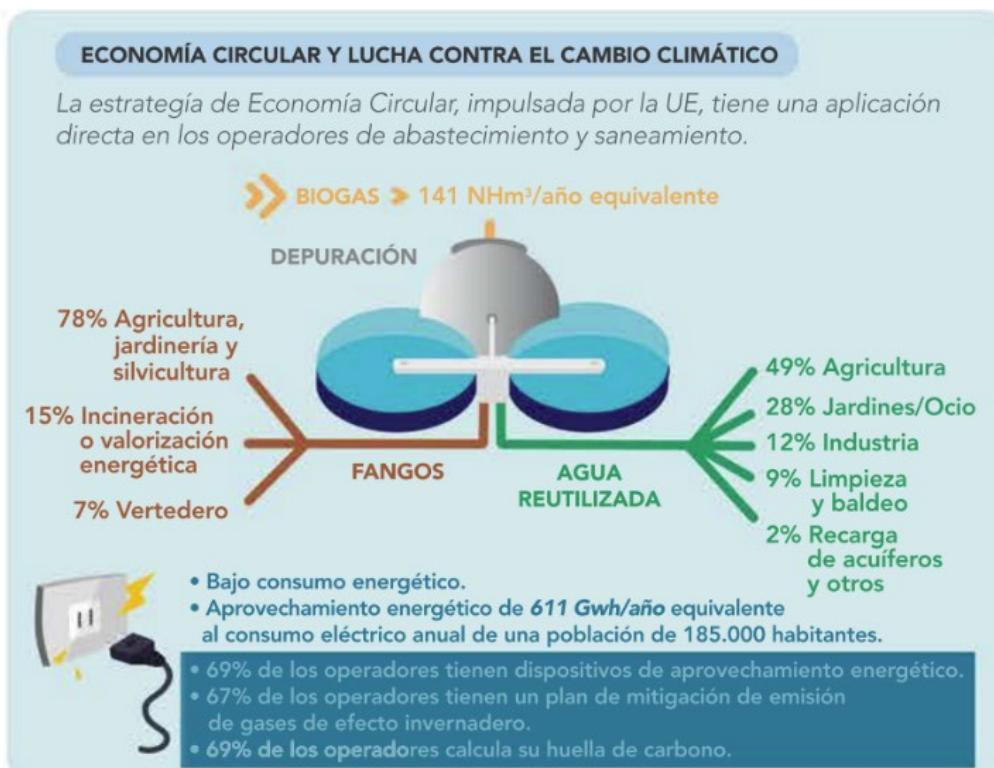

Figure 6: Circular Economy and Energy Savings Diagram. Destination of Reused Water and Sludge (AEAS)

The following figure from the European Environmental Agency depicts Wastewater Treatment Plants (WWTPs) according to the type of treatment:

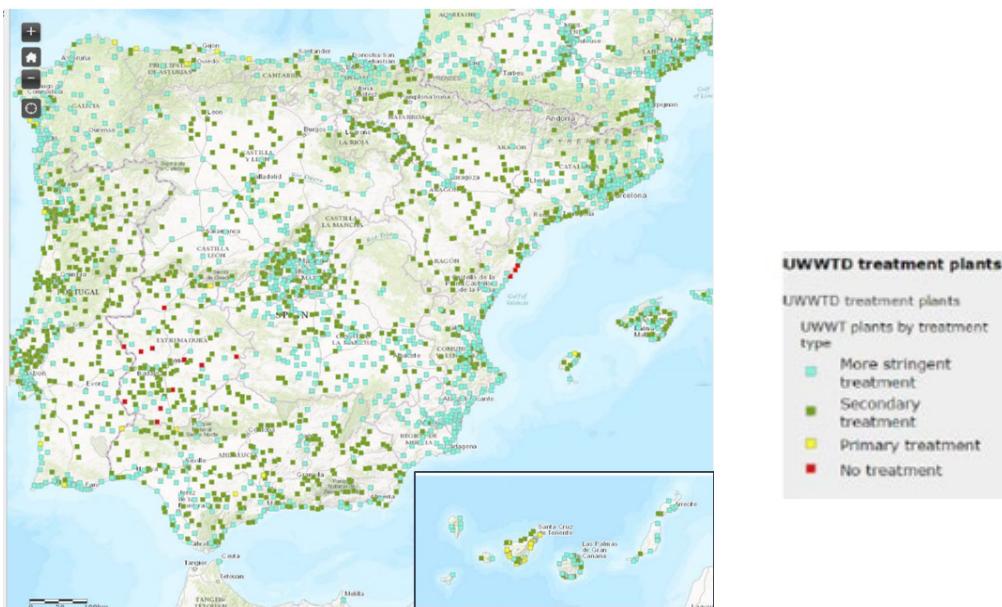

Figure 7: Wastewater Treatment Plants (WWTPs) in Spain according to the type of treatment.
(Fuente European Environment Agency)

3. Methodology

The methodology designed by Asociación Caminos includes an objective evaluation that analyzes quantitative indicators referenced to the most representative data of each sector, as well as a qualitative evaluation based on the opinions of a selected group of experts.

The **quantitative evaluation** is conducted through a comparative study with other countries in our economic and social environment, considering the most representative indicators of the sector (both from Spain and other countries). These indicators are obtained from publicly accessible databases available in important multilateral organizations such as EUROSTAT, OECD, World Bank, UN, World Economic Forum, International Transport Forum, among others. The preference is to gather data that has been collected using comparable criteria among different countries, allowing the analysis of indicators' evolution over time.

The **qualitative evaluation** exclusively pertains to Spain and is based on the responses obtained from a questionnaire sent to a selected group of experts in the sector. The responses obtained are processed anonymously and confidentially, adhering to the current data protection legislation. Once the expert responses are processed, they are integrated (with a weight of 50%) into the quantitative assessment of the sector to obtain the final evaluation of the sector in an international context.

To facilitate the evaluation, the analysis is grouped into eight sets of common characteristics for all sectors, but with specificities for each sector, referred to as "Criteria": Capacity, Performance, Financing, Adaptation to the Future and Sustainable Development, Operation and Maintenance, Safety, Resilience, and Engineering and Innovation.

The evaluation of each Criterion is obtained as a result of a weighted assessment of the selected Indicators for that Criterion. Once the eight Criteria indices for each sector are obtained, the Sector index is also calculated as a result of a new weighted assessment of these Criterion indicators.

To establish an international comparison of Spain's Complete Water Cycle sector, major European countries have been selected: Germany, France, the United Kingdom, Italy, and Turkey; four countries from the Americas: the USA, Mexico, Brazil, and Peru; three countries from Africa: Egypt, Israel, and Saudi Arabia; and three countries from Asia: Japan, China, and India. However, not all countries have been evaluated for all indicators due to a lack of basic data.

The objective indicators and expert surveys address the following questions (similar to the ASCE report) for each Criterion of each sector:

- **Capacity:** Does the provision and capacity of the public works sector meet current demands?
- **Performance:** Are the current performance and physical conditions of the public works sector adequate to meet current user expectations?
- **Financing:** What investment is allocated to financing the public works sector? How much is applied to infrastructure creation and to operation and maintenance?
- **Adaptation to the Future and Sustainable Development:** Is the capacity and performance of the public works sector prepared to meet future expectations and demands? Are the resources and investments considered adequate to cover future sector needs? How are

actions promoting environmental sustainability being implemented? Are active measures applied to achieve the established objectives for decarbonizing public works and transportation?

- **Operation and Maintenance:** Is the public works sector being operated and maintained according to its needs?
- **Safety:** Is the public works sector safe for users? Are effective measures implemented to ensure safe performance and operation?
- **Resilience:** When faced with threats and adverse incidents, what is the capacity of the public works sector to prevent, protect, and minimize consequences for users, the environment, the economy, and national security? Is the public works prepared to recover its initial state within a reasonable time once the threat or adverse incident has ceased? Are there alternatives to meet the service it provides?
- **Engineering and Innovation:** Are the resources allocated to engineering in the design, construction, conservation, management, and operation of the public works sector considered adequate? Is the investment in innovation sufficient? What new techniques, materials, technologies, and operational methods are being implemented to improve public works? Is progress being made in digitalization, monitoring, and sensing throughout the complete cycle of public works? Is the information provided to users adequate?

The methodology used to assess each Indicator is the result of an adjustment and transformation process of the selected ratios. **To avoid excessive data dispersion (due to topographical, territorial, economic, population distribution peculiarities, etc.) and to minimize the effect of outlier data points, it is necessary to limit them both from above and below. After obtaining the ratios, the dispersion of the values achieved in the different countries and years considered is analyzed.**

For this purpose, two methods have been considered for each indicator to avoid dispersion. The first method considers the mean and standard deviation of the data from the historical series, assigning as limit values the mean minus 1.5 times the standard deviation and the mean plus 1.5 times the standard deviation. The second method uses percentiles of the data from the historical series, analyzing the 90th or 80th percentile and the 10th percentile. The most suitable method to limit dispersion is adopted for each Indicator in each case. In some cases, there are exceptions to this general rule, such as the Safety indicators, for which the minimum value assigned is zero, considering it as the value that should obtain the highest score.

Once these values are obtained, they are transformed on a scale from 0 to 10, with 10 being the highest value and 0 being the lowest. Next, the following rating is assigned:

Rating System of Asociación Caminos							
Asociación Caminos	0 a 2,9	3,0 a 4,9	5,0 a 5,9	6,0 a 6,9	7,0 a 7,9	8,0 a 8,9	9,0 a 9,9
	Very Insufficient	Insufficient	Sufficient	Highly Sufficient	Good	Very Good	Excellent
	F	FX	E	D	C	B	A

Table 1: Rating system for Indicators, Criteria, and Sectors

When all the Indicators for each Criterion are calculated, they are then weighted to calculate the Criterion Indicator. This weighting is done based on the importance assigned to each Indicator in forming the Criterion Indicator.

Assigning weights to each Indicator represents one of the major challenges. To address this, the input of experts is essential. Based on their experience and knowledge, they assign these weights.

It's important to note that, to form the Criterion Indicator as a weighted assessment of the Indicators, the maximum value that the Criterion Indicator can reach is the result of summing the weight assigned to each Indicator by the maximum rating (10) that the Indicator can achieve, adjusted by a reduction coefficient (which has been considered as 0.9). The application of this reduction coefficient is considered essential to balance the integration of the indicators (for example: in the "Adaptation to the Future" Criterion, growth ratios of investment in relation to the growth of motorization rates, traffic, and population are analyzed. If the motorization rate decreases due to the increase in shared vehicle use, the sector's indicator would decrease even if the traffic increases).

As an example, for the "Operation and Maintenance" Criterion, the minimum value would be 0 (zero), and the theoretical maximum value of the Safety Indicator would be 120, reduced by 10% to 108.

Indicators	Weight	Max Score	Total Max score	
I 5,1	4	10	40	Investment and maintenance as a % of national GDP
I 5,2	1	10	10	Investment in operation and maintenance per capita
I 5,3	2	10	20	Investment in operation and maintenance per equivalent km of roads
I 5,4	1	10	10	Investment in operation and maintenance per domestic road passenger traffic (€)
I 5,5	4	10	40	Investment in operation and maintenance per domestic road freight traffic (€)
Total:	12	30	120	
% Max score over Max Value		90,0%	108,00	

When forming the Criterion Indicator, the mean and standard deviation are not taken into account, as this would distort the Criterion Indicator by overvaluing the assessments of the integration of the Indicators. However, a reduction percentage is indeed taken into consideration.

Furthermore, since data for certain countries and certain years might not always be available, this document has chosen to calculate the ratios without considering or estimating data that is not available. Thus, unverifiable or erroneous data is not considered in the assessment of the Criterion Indicator or the Sector Indicator. In this way, the Criterion Index and Sector Index only evaluate data for which there is confirmed information, following a method to prevent it from distorting the assessment achieved by a particular country.

In the earlier example, if reliable data for Indicator I 5.5 is not available for a specific country, the assessment of the Operation and Maintenance Criterion for that country would be calculated based on the maximum value of 68 (which results from subtracting 40, the maximum score of Indicator I 6.5, from 108, which is the total maximum score of all indicators, after applying the 10% reduction coefficient). For the assessment of other countries with data in all indicators, the value of 108 would be considered as the maximum score.

In other words, each country is evaluated based on the data that is truly reliable and comparable, even if fewer indicators are used for comparison with other countries. In any case, when this effect occurs, it is noted in the assessment of Criteria and the sector.

4. Quantitative Indicators of the Complete Water Cycle

For the comparative study, 57 quantitative indicators have been used, all of which are referenced to the most representative data in the sector (both from Spain and other countries), obtained from publicly accessible databases available in important multilateral organizations (EUROSTAT, OECD, World Bank, UN, World Economic Forum, International Transport Forum, UIC, etc.). The selection of sub-indicators took into account the opinions and experience of the consulted experts. It was also essential to have the appropriate database to compose the sub-indicator. The time period considered for this comparative study covers 5 years: from 2015 to 2019. It was not deemed appropriate to go beyond the year 2019 due to the distortion caused by the COVID-19 pandemic, which significantly altered the comparison of indicators in 2020 and partially during 2021.

Once the available databases were analyzed, it was considered appropriate to use the following databases:

- The World Bank (WB)
 - Population
 - Surface area
 - GDP (USD)
- World Economic Forum (WEF)
 - Quality indicators of the Complete Water Cycle infrastructure
- United Nations (UN), Food and Agriculture Organization (FAO), and AQUASTAT
 - % of the population using basic drinking water services
 - % of the population using basic sanitation services
 - % of the population using safely managed drinking water services
 - % of the population using safely managed sanitation services
 - Water extracted for non-domestic use/irrigated area (m³/ha)
 - Irrigated area (Mill Ha)
 - Available water per capita (Renewable freshwater resources/Population) (m³/year)
 - Water stress (Water extracted/Freshwater resources -Environmental flow) (%) (SDG: 6.4.2)
 - % of integrated water resources management (SDG: 6.5.1)
 - % Change in the permanent water area of lakes and rivers (SDG: 6.6.1)
 - % Annual freshwater withdrawal for domestic use/Total freshwater withdrawal
 - Renewable freshwater resources (10⁹ m³)
 - % of agricultural land under irrigation/total agricultural land
 - Agricultural land area (km²)
 - Water extracted for non-domestic use (Freshwater resources extracted - Water extracted for domestic use) (10⁹ m³)
 - % of water bodies in good ecological status (SDG: 6.3.2)
 - Water use efficiency (USD/m³) (SDG: 6.4.1)
 - m³ of treated wastewater
- University of Notre Dame (ND-GAIN)
 - Global Adaptation Index indicators from the University of Notre Dame (ND-GAIN)
 - Freshwater extraction rate (ND-GAIN Water Index)

- Water dependency ratio (ND-GAIN Water Index)
- Dam capacity (National GDP (Current €))
- Statistical Annex. Transport in the EU 2018.
- Acidity (ND-GAIN Water Index)
- OECD-International Transport Forum (OCDE)
 - Percentage of wastewater collected in sewer systems
 - Research, development, and innovation
- EUROSTAT and EU
 - National GDP (Current €)
 - Statistical Annex. Transport in the EU 2018.
 - EU economic investment report 2017-2018-2019

COMPLETE WATER CYCLE INDICATORS	
1 CAPACITY	
Water C.1	% of the population with access to basic drinking water services
Water C.2	% of the population with access to basic sanitation services
Water C.3	Water extracted for non-domestic use/irrigated area (m3/ha)
Water C.4	% Irrigated area/total area
Water C.5	(100-Water stress index)*available water per capita (m3)
Water C.6	% Irrigated area/agricultural land area
Water C.7	Water stress index (Water extracted from freshwater resources/(Renewable freshwater resources - Environmental flow) (%) (SDG: 6.4)
2 PERFORMANCE	
Water P.1	Percentage of population using safely managed drinking water services
Water P.2	Percentage of population using safely managed sanitation services
Water P.3	Water use efficiency (USD/m3)/(GDP*10,000) (SDG: 6.4.1) UN
Water P.4	Percentage of wastewater collected in sewer systems
Water P.5	% of population connected to a wastewater treatment plant - primary treatment - (OECD)
Water P.6	% of population connected to a wastewater treatment plant - secondary treatment - (OECD)
Water P.7	% of population connected to a wastewater treatment plant - tertiary treatment - (OECD)
3 FINANCING	
Water F.1	(Total Expenditure Water Cycle Sector / population)*Investment Needs
Water F.2	(Total Expenditure Water Cycle Sector / real GDP) * Investment Needs * 1,000,000
Water F.3	(Maintenance expenditure / Total expenditure) * Investment Needs
Water F.4	Total Expenditure Water Cycle Sector / population
Water F.5	Total Expenditure Water Cycle Sector / real GDP
Water F.6	Operation and maintenance expenditure / Total expenditure
Water F.7	Investment Needs
4 Adaptation to the Future and Sustainability	
Water A.1	Freshwater resources (long-term average) - Evapotranspiration - (m3/person) (OECD)
Water A.2	Freshwater resources (long-term average) - Total renewable per capita (m3/person) - (OECD)
Water A.3	Freshwater extraction (long-term average) (millions m3) - Gross extraction per capita (m3/person) - (OECD)
Water A.4	Projected change in annual runoff (ND-GAIN Water Index)
Water A.5	Projected change in annual groundwater recharge (ND-GAIN Water Index)
Water A.6	Fresh water withdrawal rate (ND-GAIN Water Index)
Water A.7	Water dependency ratio (ND-GAIN Water Index)
Water A.8	Dam capacity (ND-GAIN Water Index)
Water A.9	% Technologies related to water treatment and purification (OECD)
Water A.10	% Gross extraction of freshwater per capita / total renewable freshwater per capita
5 OPERATION AND MAINTENANCE	
Water O.1	Expenditure on water sector operation and maintenance / population
Water O.2	% Expenditure on water sector operation and maintenance / real GDP
Water O.3	Reliability of water supply. GCI Index (WEF)
6 SECURITY	
Water S.1	Premature deaths, per million inhabitants (unsafe water source) (OECD)
Water S.2	Premature deaths, per million inhabitants (Unsafe sanitation) (OECD)
Water S.3	Premature deaths, per million inhabitants (Lack of safe handwashing facilities) (OECD)
7 RESILIENCE	
Water R.1	Available water per capita (Renewable freshwater resources/Population) (m3/year)
Water R.2	(Renewable freshwater resources*(1-Water stress index))/agricultural land area (m3/ha)
Water R.3	% Integrated water resources management (SDG: 6.5.1)
Water R.4	% Annual freshwater extraction for domestic use/Total freshwater extraction
8 ENGINEERING AND INNOVATION	
Water I.1	Number of patents related to water treatment and purification per million population (OECD)
Water I.2	Number of patents related to water pollution reduction per million population (OECD)
Water I.3	Number of patents. Desalination of seawater per million population (OECD)
Water I.4	% of GDP allocated to Gross Domestic Expenditure on Research and Development (R&D) (OECD R&D)
Water I.5	Gross Domestic Expenditure on Research and Development (\$)/Population (OECD R&D)
Water I.6	% of GDP allocated to basic research expenditure (OECD R&D)
Water I.7	% of GDP of Private Funding for Research and Development (R&D) (OECD R&D)
Water I.8	% of GDP of Public Funding for Research and Development (R&D) (OECD R&D)
Water I.9	Digitization. Participation in new technologies. GCI Score (WEF)
Water I.10	Digitization. Information and Communication Technology Infrastructure Index. (ND Index)
Water I.11	Digitization. % of people using the internet
Water I.12	Engineering. Regulatory transparency. Services Trade Restrictiveness Index (OECD)
Water I.13	Engineering. Barriers to competition. Services Trade Restrictiveness Index (OECD)
Water I.14	Engineering. Movement restrictions. Services Trade Restrictiveness Index (OECD)
Water I.15	Engineering. Restrictions on entry of foreign engineers. Services Trade Restrictiveness Index (OECD)
Water I.16	Innovation index. ND Gain Index

4.1. Capacity

The indicators in this criterion aim to answer the question: Does the provision and capacity of the public works sector meet current demands?

To address this, the following indicators have been selected:

1 CAPACITY	
Water C.1	% of the population with access to basic drinking water services
Water C.2	% of the population with access to basic sanitation services
Water C.3	Water extracted for non-domestic use/irrigated area (m ³ /ha)
Water C.4	% Irrigated area/total area
Water C.5	(100-Water stress index)*available water per capita (m ³)
Water C.6	% Irrigated area/agricultural land area
Water C.7	Water stress index (Water extracted from freshwater resources/(Renewable freshwater resources - Environmental flow) (%)) (SDG: 6.4)

For the evaluation of this Criterion, seven indicators have been used. The first two analyze the percentage of the population with access to basic drinking water and sanitation services; the third relates water extracted for non-domestic use to the irrigated area; the fourth indicates the percentage of irrigated area in relation to the total area, and the sixth indicates the percentage of irrigated area in relation to the agricultural land area. The fifth and seventh indicators aim to reflect water stress.

Indicator 6.4.2 of the United Nations 2030 Agenda defines water stress as the ratio of total freshwater withdrawn (Total Flow Water Withdrawn) to the total freshwater resources (Total Renewable Fresh Water Resources), after accounting for environmental flow requirements (Ambiental Environmental Flow Requirements). The mathematical definition is: Water stress (%) = TFWW / (TRWR - EFR) * 100 (Unit of variables: km³/year, or 10⁹m³/year). The interpretation of values is as follows: No stress < 25%; Low stress: 25% - 50%; Medium stress: 50% - 75%; High stress: 75% - 100%; Critical stress > 100%.

Based on water stress, the indicator is also calculated: (100-Water stress index) * available water per capita (m³). This indicator is representative of the water need of countries.

In the following figure, the baseline water stress is presented, measured as the ratio of total water withdrawals compared to available renewable water supply¹ (Source: WRI (2019)). As observed, Spain, along with Italy and Greece, has the highest values in Europe. Spain exhibits extremely high risk in the southeast of the peninsula.

¹ Water withdrawals include consumptive and non-consumptive domestic, industrial, irrigation, and livestock uses. Available renewable water supplies include groundwater and surface water supplies and take into account the impact of upstream water users and large dams on the availability of downstream flowing water. Higher values indicate more competition among users.

Table 18: Weights and maximum reduced scores of the Capacity Indicators

It can be observed that the indicator "% of the population with access to basic potable water services" presents high values. More developed countries have very high percentages (between 99% and 100%), developing countries range between 95% and 97%, and less developed countries between 90% and 95%. India has the lowest value (90%) and China 95%. All European countries (except Turkey), the USA, and Japan have a 100%.

The indicator "% of the population with access to basic sanitation services" also presents high values, although lower than the first indicator. India has the lowest percentage (68%), China 75%, and Peru 78%. Similar to the previous indicator, European countries, the USA, and Japan have 99%.

These two indicators are considered essential for human development, as recognized by all international organizations, and are a priority for development aid.

The indicator "Water extracted for non-domestic use/irrigated area) (m³/ha)" is representative for analyzing available water for irrigation. Naturally, drier countries have a lower available volume, but it's also necessary to consider water extraction and the area under irrigation. Thus, Germany, the United Kingdom, Peru, Egypt, and Japan have high ratios; however, Israel, Spain, France, China, and India have low values.

Regarding the percentage of Irrigated Area/Total Area, India stands out (19.1%), followed by Israel (9.8%), Italy (8.7%), and Spain (7.5%). Naturally, countries with higher rainfall have less need for irrigated area.

The indicator of water stress is important². Countries without water stress (values below 25%) are Brazil, Peru, the United Kingdom, and France. Countries with critical stress (values above 100%) are Saudi Arabia, Egypt, and Israel. The rest of the countries fall into intermediate values.

Spain has a favorable ratio in relation to the "Percentage of Irrigated Area/Total Area" indicator (14.5%), surpassed by Egypt, Japan, India, and Italy.

Overall, Japan has the best rating in the Capacity Criterion, closely followed by Italy and the USA. Saudi Arabia and China have the lowest ratings.

² Indicator 6.4.2 of the United Nations' 2030 Agenda defines water stress as the relationship between the total flow of withdrawn freshwater (Total Flow Water Withdrawn) and the total renewable resources of freshwater (Total Renewable Fresh Water Resources), considering environmental flow requirements (Ambiental Environmental Flow Requirements). The mathematical definition is: Water stress (%) = TFWW / (TRWR - EFR) * 100 (Unit of variables: km³/year, or 10⁹m³/year). The interpretation of the values is as follows: No stress < 25%; Low stress: 25% - 50%; Medium stress: 50% - 75%; High stress: 75% - 100%; Critical stress > 100%.

4.2. Performance

This criterion addresses the question: Are the current performance and physical conditions of the public infrastructure sector adequate to meet the current expectations of users?

The selected indicators are as follows:

2 PERFORMANCE	
Water P.1	Percentage of population using safely managed drinking water services
Water P.2	Percentage of population using safely managed sanitation services
Water P.3	Water use efficiency (USD/m3)/(GDP*10,000) (SDG: 6.4.1) UN
Water P.4	Percentage of wastewater collected in sewer systems
Water P.5	% of population connected to a wastewater treatment plant - primary treatment - (OECD)
Water P.6	% of population connected to a wastewater treatment plant - secondary treatment - (OECD)
Water P.7	% of population connected to a wastewater treatment plant - tertiary treatment - (OECD)

These indicators analyze the performance, the level of development of the network, the extent of wastewater treatment, and the needs of the water supply and sanitation system in countries.

Unfortunately, not all countries have been evaluated for all indicators. Some databases come from EUROSTAT, which is why data from non-EU countries are not available.

			90% valorado de la Max. Puntuación del Criterio	90,0%	135

Table 35: Weights and maximum reduced score of the Performance Sub-Indicators

In the "Percentage of the population using safely managed potable WATER" indicator, the same trend observed in the Capacity Indicators is evident: more developed countries show very good ratios, while less developed ones have significantly lower values. The worst-rated countries are Mexico and Peru, followed by India, China, and Egypt.

The "Percentage of the population using safely managed sanitation services" indicator follows the same trend as the previous indicator, but with lower values.

The "Efficiency in WATER use (USD/m3)/(GDP*10,000) (SDG: 6.4.1) UN" indicator refers to the price of per cubic meter of WATER paid by users. The United Kingdom stands out with the highest price (87 USD/m3). The lowest prices are seen in the United States and Peru (8 USD/m3). Spain, along with Italy and Turkey, has the lowest prices among the analyzed European countries.

Indicators analyzing the treatment of wastewater also display the same differences between developed and developing countries. The percentage of wastewater collected in sewer systems is high in all European countries, the United States, and Israel (ranging from 97% to 80%). It's notable that France only collects 82% of wastewater for treatment, possibly due to the presence of septic tanks in many of its municipalities.

Indicators related to wastewater treatment (primary, secondary, and tertiary) are presented to detail the quality of treatment, with varying and more significant weights allocated to more complex treatment methods: "% of the population connected to a wastewater treatment plant - tertiary treatment- (OECD)".

The overall assessment of the Performance Criterion is excellent in the United States, the United Kingdom, and Spain, followed by other European countries, Israel, and Japan.

4.3. Financing

The question that this criterion aims to answer is: How much investment is allocated to funding the public works sector? How much is applied to infrastructure creation? And how much to operation and maintenance?

The financing of infrastructure is a critical criterion for evaluating the quality of the infrastructure and encompasses two distinct elements: investment in infrastructure creation and investment in conservation, operation, and maintenance. In countries where the Complete Water Cycle infrastructure is mature, there is less overall investment allocated compared to countries where it is still being developed. Consequently, a significant percentage is allocated to conservation in relation to creation. On the other hand, in countries where the infrastructure is under development and creation, the investment directed towards infrastructure creation is much more substantial compared to investment in conservation. Unfortunately, separating investment in creation from investment in conservation is not straightforward.

For the purposes of this report, the following seven indicators have been considered:

3 FINANCING	
Water F.1	(Total Expenditure Water Cycle Sector / population)*Investment Needs
Water F.2	(Total Expenditure Water Cycle Sector / real GDP) * Investment Needs * 1,000,000
Water F.3	(Maintenance expenditure / Total expenditure) * Investment Needs
Water F.4	Total Expenditure Water Cycle Sector / population
Water F.5	Total Expenditure Water Cycle Sector / real GDP
Water F.6	Operation and maintenance expenditure / Total expenditure
Water F.7	Investment Needs

One of the most representative indicators is investment in the Complete Water Cycle relative to the national GDP. The evolution of this indicator over the years provides valuable information about the level of infrastructure development in the country and the state of its conservation. A high percentage of GDP (above 0.7% or 0.8%) indicates that the Complete Water Cycle is in the process of being created. In general terms, if this percentage falls below 0.4%, it suggests that new infrastructure is not being created. Additionally, if this percentage drops below 0.2-0.3%, it indicates that the investment also inadequately covers the needs for conservation, maintenance, and management of the infrastructure.

The "Investment Needs" ratio is defined as the percentage of the population without safe drinking water multiplied by the percentage of the population without safe sanitation. This ratio has been used to apply it to the total expenditure of the water cycle as a share of GDP and the total expenditure per capita to consider the effect of the level of development of the complete cycle network in assessing investment.

The data for "Total Expenditure of the Water Cycle" and "Operation and Maintenance Expenses" have been collected from the organization "GLOBAL WATER INTELLIGENCE" (GWI), albeit indirectly (via the Confederation of Danish Industry, an organization linked to GWI that utilizes GWI's data).

Table 52: Evaluation on a scale of 0 to 10 of the Financing Criterion

As mentioned, the most relevant indicator is the investment in the Complete Water Cycle as a percentage of GDP. The average value for the countries and years analyzed is 0.39%, with a maximum of 0.91% reached in 2019 by Egypt. Spain has a low value, 0.16% of GDP in 2019, the lowest among the analyzed European countries. The highest value in 2019 is held by Egypt and Japan (0.91% and 0.66% respectively). Among the European countries, Turkey (0.46%), France (0.44%), and the United Kingdom (0.36%) are the highest investors.

Some interesting insights derived from the used indicators are reflected in the following table:

Indicator	Average	Minimum Value	Maximum Value
Percentage of total expenditure of the water cycle in relation to GDP	0,39%	0,15%	0,91%
Total expenditure of the Water Cycle sector per capita	89\$	11\$	267\$
Investment needs	0,311	0,021	0,81

The significant dispersion of the results shown in the previous table reflects a reality: countries that, during the analyzed years in the report (2015-2019), are creating new infrastructure or undergoing significant transformations in their networks, exhibit higher values. This indicates a substantial commitment to the development and improvement of the Complete Water Cycle network.

The "Investment Needs" ³ ratio displays very diverse values among the analyzed countries. For instance, it highlights that Mexico, Peru, and India require significant investments. Conversely, both Germany and the United Kingdom, along with Israel, the United States, and Spain, require less investment.

Spain receives a relatively high rating in this Criterion (6.0), similar to the scores of other European countries (with France standing out at 7.2). Israel achieves the highest rating (10), while Mexico, Peru, and India receive the lowest ratings.

³ Investment Needs = % of population without safe drinking water management X % of population without safe sanitation management

4.4. Adaptation to the Future and Sustainability

The questions addressed in this criterion are: Is the capacity and performance of the public infrastructure sector prepared to meet future expectations and demands? Are the resources and investments considered sufficient to cover the future needs of the sector? How are actions promoting environmental sustainability being implemented? Are active measures being taken to achieve the established goals for decarbonizing public infrastructure and transportation?

The selected Indicators are as follows:

4 Adaptation to the Future and Sustainability	
Water A.1	Freshwater resources (long-term average) - Evapotranspiration - (m3/person) (OECD)
Water A.2	Freshwater resources (long-term average) - Total renewable per capita (m3/person) - (OECD)
Water A.3	Freshwater extraction (long-term average) (millions m3) - Gross extraction per capita (m3/person) - (OECD)
Water A.4	Projected change in annual runoff (ND-GAIN Water Index)
Water A.5	Projected change in annual groundwater recharge (ND-GAIN Water Index)
Water A.6	Fresh water withdrawal rate (ND-GAIN Water Index)
Water A.7	Water dependency ratio (ND-GAIN Water Index)
Water A.8	Dam capacity (ND-GAIN Water Index)
Water A.9	% Technologies related to water treatment and purification (OECD)
Water A.10	% Gross extraction of freshwater per capita / total renewable freshwater per capita

The OECD has data related to the freshwater resources of countries. Among these, the following have been selected: evapotranspiration (m3/person), renewable freshwater (m3/person), and gross freshwater extraction (average annual long-term) (m3/person). With these values, the percentage of gross freshwater extraction in relation to total renewable freshwater has been calculated. This last indicator shows the vulnerability of countries in relation to freshwater.

To analyze how countries are adapting to climate change and environmental sustainability in relation to water use, the University of Notre Dame (Indiana, USA) has been developing an indicator known as the "ND-Gain"⁴. This indicator assesses a country's vulnerability⁵ to climate change and also evaluates its readiness⁶ to utilize public and private sector investment for implementing climate change adaptation actions. The ND-Gain index compiles over 74 variables to create 45 fundamental indicators for measuring vulnerability and readiness for 192 United Nations countries from 1995 to the present (due to data availability, ND-Gain measures the vulnerability of 182 countries and the readiness of 184 countries).

Among these indicators, five related to water have been selected:

⁴ Please refer to the detailed information in the corresponding Annex.

⁵ ND-Gain defines the concept of Vulnerability as: The propensity or predisposition of human societies to be negatively impacted by climate threats.

⁶ ND-Gain defines the concept of Readiness as: The willingness to effectively utilize investments for adaptation actions through a secure and efficient business and governmental environment..

Proyección del cambio en la escorrentía anual (ND-GAIN Water Index.)
Proyección del cambio en la recarga anual de aguas subterráneas. (ND-GAIN Water Index.)
Tasa de extracción de agua dulce. (ND-GAIN Water Index. Fresh water withdrawal rate)
Ratio de dependencia del agua originada en el exterior de sus fronteras. (ND-GAIN Water Index)
Capacidad de presas. (ND-GAIN Water Index. Dam capacity)

The first one indicates the effects that climate change will bring to runoff natural water resources by mid-century. It is expressed as the percentage change in annual runoff from the reference projection (1990-2009) to the future projection (2040-2069).

The second one shows how climate change will affect annual groundwater resources.

The third relates to the assessment of total real renewable water resources (including desalinated water).

The fourth assesses the dependence on total renewable water resources originating from outside the country.

The fifth assesses the capacity to adapt to changes in water distribution (both temporal and geographical). It measures the per capita storage capacity of dams within a country in response to changes in freshwater resources, including effects due to climate change (including incoming surface and groundwater or resources secured by bilateral treaties).

Table 75: Weights and reduced maximum scores of the Indicators for Future Adaptation and Sustainability

In the Indicator that measures evapotranspiration per capita, Israel stands out with a ratio of 431 m³/person, much lower than the rest of the countries for which data is available (Brazil, Peru, Egypt, Saudi Arabia, China, and India are not evaluated), most likely due to storage being carried out in tanks or areas protected from solar exposure that causes evapotranspiration. Spain has the highest evapotranspiration among the analyzed European countries (4,805 m³/person).

Renewable freshwater resources per capita (in long-term annual average) show similar results across all European countries (around 2,400 m³/person). The United States stands out with 7,521 m³/person. Israel faces the most challenging situation with only 307 m³/person.

In the Indicator measuring freshwater extraction per capita, Spain is unfavorably high (633 m³/person); the United States has the highest ratio (1,207 m³/person), double that of European countries. Israel extracts the least amount (129 m³/person), and Egypt and Saudi Arabia are likely in similar situations, although data is not available.

Regarding the University of Notre Dame (ND-GAIN) Indicators, they indicate a high vulnerability for most countries, but with different ratings based on the Indicator. The following table shows the results of these Indicators in comparison to those obtained by Spain:

ND-Gain Vulnerability Indicator	Max (1,00 worst)	Min (0,00 best)	Spain
Projection of Change in Annual Runoff	0,87	0,40	0,45
Projection of Change in Annual Groundwater Recharge	0,32	0,13	0,19
Freshwater Extraction Rate	1,00	0,01	0,24
Dependency Ratio of Externally Sourced Freshwater	0,98	0,00	0,00
Dam Capacity	0,99	0,15	0,72

Spain stands out in the freshwater dependency ratio and dam capacity indicators. It is evident that Spain generates all of its freshwater resources within its own borders, without depending on any rivers originating outside its territory. In terms of dam capacity, the indicator shows a favorable result, ranking behind only Brazil (due to the dams in the Amazon), Egypt (the Nile River dams, especially the Aswan Dam), and the United States (due to the high regulation capacity of its major rivers).

In the percentage of technologies related to water treatment and purification, Spain achieves a moderate rating. The highest ratings are obtained by Mexico and Brazil.

In the indicator measuring the percentage of freshwater extraction compared to renewable freshwater resources, Spain (along with Turkey) has a relatively high ratio (27%), surpassed only by Israel (41.9%). This result has significant implications, suggesting that Spain's ability to extract more freshwater than it has available is limited compared to other countries. Therefore, it should pay great attention to and manage its water consumption in the future.

In the final index of adaptation to the future and sustainable development, the highest-rated country is Brazil (7.8). Spain's rating is similar to the analyzed European countries (6.6 within the range of 5.8-7.0). The lowest ratings are achieved by countries in Africa: Saudi Arabia (0.6), Egypt (2.7), and Israel (3.9). India also receives an insufficient rating (4.1).

4.5. Operation and Maintenance

The questions addressed in this criterion are: Is the public infrastructure being operated and maintained according to its needs? Is the necessary investment being made to ensure proper conservation and maintenance?

The selected indicators are as follows:

5 OPERATION AND MAINTENANCE	
Water O.1	Expenditure on water sector operation and maintenance / population
Water O.2	% Expenditure on water sector operation and maintenance / real GDP
Water O.3	Reliability of water supply. GCI Index (WEF)

It should be noted that separating investment in operation and maintenance is very challenging: budget allocations are not always well-defined, and sometimes the national accounting of certain countries does not distinguish this separation, making the data unreliable.

The investment needs for operation, conservation, and maintenance are linked to the state of the infrastructure and the requirements for adapting to new technical, functional, and technological demands. There has been extensive debate among experts about the necessary investment for proper maintenance. While there is no widespread consensus on an exact percentage, it is generally considered that the required investment for conservation should range between 2% and 4% of the asset value of the infrastructure, depending on its condition. This would also need to cover the operating costs of systems related to the water cycle, which can be substantial. Calculating the asset value requires establishing consensus criteria that can reflect reality. Some attempts have been made to determine asset value, but they are not standardized, and verifiable and comparable data are lacking.

Similarly to what has been discussed regarding the Financing Criterion, the percentage of GDP allocated to conservation serves as an indicator that can provide guidance on the adequacy of investment for maintenance needs. To further specify and supplement this indicator, investment per capita has also been considered. The reliability of water supply is linked to good conservation and maintenance practices. To assess this parameter, the "Water Supply Reliability" indicator from the World Economic Forum's Global Competitiveness Index (GCI) has been utilized.

Table 84: Operation and Maintenance Criterion Rating

As previously mentioned, the most significant ratio for evaluating the Operations and Maintenance Criterion is the percentage of investment in operation and maintenance relative to asset value. However, obtaining this value for the entire water cycle infrastructure is not feasible. Therefore, the investment in operation and maintenance relative to GDP has been used, although it could not be obtained for all countries. The average value of the ratio "% Operating and Maintenance Expenses in the Water Sector / Real GDP" is 0.62%, with a maximum of 1.3% and a minimum of 0.28%, which corresponds to India. Spain's percentage is 0.83%.

Another indicative ratio is the percentage of investment in operation and maintenance relative to the population. The resulting average value is \$168, with a maximum of \$453 and a minimum of \$5. Spain's value is \$244.

Regarding the "Water Supply Reliability" indicator from the World Economic Forum's Global Competitiveness Index (GCI), Spain, France, the United Kingdom, Israel, and Japan have the best results (over 90 out of 100).

In the overall Operations and Maintenance Criterion, Spain is rated as very good (8.6). The countries with the highest ratings are France and Japan (10), while the countries with the lowest ratings are India, China, and Mexico.

4.6. Safety

Within this criterion, the safety of the service provided by the entire water cycle is evaluated. The questions that this criterion aims to answer are: Is the public works sector safe for users? Are effective measures implemented to ensure safe performance and operation?

The chosen indicators are:

6 SECURITY	
Water S.1	Premature deaths, per million inhabitants (unsafe water source) (OECD)
Water S.2	Premature deaths, per million inhabitants (Unsafe sanitation) (OECD)
Water S.3	Premature deaths, per million inhabitants (Lack of safe handwashing facilities) (OECD)

For the assessment of this criterion, OECD indicators related to premature deaths per million inhabitants due to unsafe water supply, inadequate sanitation, and lack of access to a safe handwashing facility have been utilized.

As mentioned in the methodological notes, the minimum value for evaluation in the indicators of this criterion has been set at zero, as society considers it an indispensable goal to eliminate deaths resulting from inadequate water supply and sanitation.

4.6.1. Safety Indicators

4.6.1.1 Indicator WATER S.1: Premature deaths, per million inhabitants (unsafe water source) (OECD)

Table 93: Safety Criterion Rating

The indicator "Premature deaths per million inhabitants (unsafe water source) (OECD)" has an average of 33 fatalities, with significant variations among countries: ranging from a minimum of 2 in all European countries, the US, and Israel, to a maximum of 372 in India. Spain's figure is 1.11, which places it among the better-performing countries.

The second sub-indicator analyzed, "Premature deaths per million inhabitants (unsafe sanitation) (OECD)," presents values that are in line with the first indicator. Notable performers are the UK (0.12) and Spain (0.27), while India has the highest figure (213). A similar situation is seen in the third indicator, "Premature deaths per million inhabitants (lack of access to safe handwashing) (OECD)."

Overall, the best-rated countries are European nations, the US, and Israel, with slight variations between them. India stands out as the worst-performing country, with a significant gap compared to the rest. Following India, there is a considerable distance, and countries like Mexico, Brazil, Peru, and Egypt also fare worse than the better-performing countries.

4.7. Resilience

Resilience is the ability of a system to recover its initial state when disruptions that have altered the system have ceased. The question posed is as follows: When threats and adverse incidents occur, what is the capacity of public infrastructure to prevent, protect, and minimize consequences for users, the environment, the economy, and national security? Is public infrastructure prepared to recover its initial state within a reasonable time after the threat or adverse incident has ceased? Are there alternatives to maintain the service it provides?

The chosen indicators are:

7 RESILIENCE	
Water R.1	Available water per capita (Renewable freshwater resources/Population) (m ³ /year)
Water R.2	(Renewable freshwater resources*(1-Water stress index))/agricultural land area (m ³ /ha)
Water R.3	% Integrated water resources management (SDG: 6.5.1)
Water R.4	% Annual freshwater extraction for domestic use/Total freshwater extraction

To adequately address the posed question, data related to the technical characteristics of the design of the entire water cycle infrastructure would be required. This would include information on soil conditions and vulnerability to adverse phenomena, drainage capacity of the infrastructure (to assess if flood return periods are appropriate for flood prevention), stability of slopes and cuttings within the infrastructure, organization and equipment of maintenance teams to efficiently and rapidly respond to any eventuality, and more.

As it's not feasible to gather all these data points for the entire water cycle infrastructure (which would be a labor-intensive task), the approach has been to consider indicators that, indirectly, can provide some insight into the resilience of the entire water cycle sector.

Per capita available water indicates vulnerability and the ability to respond to water supply issues during drought or water scarcity situations.

The evaluation of renewable freshwater resources per agricultural land area of the country, corrected for water stress, also provides information about the agriculture sector's ability to respond to freshwater scarcity phenomena.

The Sustainable Development Goal 6.5.1 indicator "% of integrated water resources management" helps verify whether centralized management can address adverse events. Centralized management allows for contingency plans and comprehensive actions in emergency situations affecting all processes within the water cycle; overly decentralized management may hinder a coordinated response.

The last considered indicator is the percentage of freshwater extraction for domestic use in relation to the total freshwater extraction. This indicator allows for the evaluation of available resources for domestic use during scarcity situations.

India	8,1	8,1	8,1	8,1	8,1	MUY BIEN	B

Table 104: Resilience Criterion Rating

The highest overall rating for this indicator is achieved by Japan (10.0), followed by France (9.6) and the USA (9.4), with European countries, including Spain, also ranking well (6.9). The lowest-rated countries are Egypt, Israel, and Saudi Arabia.

4.8. Engineering and Innovation

The evaluation of innovation through indicators aims to answer the following questions: Are the resources allocated to engineering in the design, construction, maintenance, management, and operation of the public works sector adequate? Is the investment in innovation appropriate? What new techniques, materials, technologies, and operational methods are being implemented to improve public works? Is there progress in digitalization, monitoring, and sensorization throughout the entire lifecycle of public works? Is the information provided to users adequate?

The selected indicators are:

8 ENGINEERING AND INNOVATION	
Water I.1	Number of patents related to water treatment and purification per million population (OECD)
Water I.2	Number of patents related to water pollution reduction per million population (OECD)
Water I.3	Number of patents. Desalination of seawater per million population (OECD)
Water I.4	% of GDP allocated to Gross Domestic Expenditure on Research and Development (R&D) (OECD R&D)
Water I.5	Gross Domestic Expenditure on Research and Development (\$)/Population (OECD R&D)
Water I.6	% of GDP allocated to basic research expenditure (OECD R&D)
Water I.7	% of GDP of Private Funding for Research and Development (R&D) (OECD R&D)
Water I.8	% of GDP of Public Funding for Research and Development (R&D) (OECD R&D)
Water I.9	Digitization. Participation in new technologies. GCI Score (WEF)
Water I.10	Digitization. Information and Communication Technology Infrastructure Index. (ND Index)
Water I.11	Digitization. % of people using the internet
Water I.12	Engineering. Regulatory transparency. Services Trade Restrictiveness Index (OECD)
Water I.13	Engineering. Barriers to competition. Services Trade Restrictiveness Index (OECD)
Water I.14	Engineering. Movement restrictions. Services Trade Restrictiveness Index (OECD)
Water I.15	Engineering. Restrictions on entry of foreign engineers. Services Trade Restrictiveness Index (OECD)
Water I.16	Innovation index. ND Gain Index

To comprehensively analyze engineering and innovation in the Complete Water Cycle, a deep understanding of new techniques, materials, and technologies applied in the water cycle, as well as implemented innovations, the state of water cycle engineering, advancements in digitization, and resources allocated to engineering and innovation are required.

Regarding innovation, three OECD patent indicators have been identified: the number of patents related to treatment and purification, pollution reduction in water, and desalination, all per million inhabitants. Despite efforts to gather more specific data on the Complete Water Cycle infrastructure sector, no further reliable and verifiable data has been found. In the absence of such data, the overall state of R&D and innovation in various countries has been analyzed, assuming these data to reflect the state of the water cycle. For this purpose, a database and indicators from the report "Main Science and Technology Indicators, Volume 2021," published by the OECD in 2022, have been selected. This comprehensive report provides a set of indicators reflecting the level and structure of efforts made by OECD⁷ member countries and other non-member countries (Argentina, People's Republic of China, Romania, Russian Federation, Singapore, and South Africa) in the field of science and technology. These indicators cover resources dedicated to research and development, patent families, and international trade in R&D-intensive industries.

The University of Notre Dame's Innovation Index (ND Gain index) has also been considered.

⁷ [Main Science and Technology Indicators, Volume 2021 Issue 2 | READ online \(oecd-ilibrary.org\)](https://www.oecd-ilibrary.org/main-science-and-technology-indicators-volume-2021-issue-2-read-online/oecd-ilibrary.org)

To analyze the progress of digitization, three indicators have been included: participation in new technologies (GCI - WEF), the ICT Infrastructure Index (ND Gain Index), and the number of internet users.

For assessing the state of engineering in the water cycle sector, having precise information about the training of water cycle engineers, the number of engineers involved in design, construction, maintenance, and management per unit of economic investment would have been valuable. It would have been particularly interesting to have economic data related to engineering investment in comparison to investment in construction, maintenance, operation, and management of water cycle networks. Unfortunately, this data was not available. Therefore, four OECD indicators related to engineering as a whole have been considered: regulatory transparency, barriers to competition, restrictions on the movement of engineers, and restrictions on the entry of foreign engineers. These indicators are included in the trade in services restriction index periodically compiled by the OECD⁸.

Table 139: Engineering and Innovation Criterion Rating

The OECD indicators related to research and development (R&D) showcase the global strategic position of countries in various sectors of the economy with respect to research. The indicator "% of GDP spent on gross domestic expenditure on R&D" for the analyzed countries spans a wide spectrum, ranging from a maximum of 3.21% (Japan) to a minimum of 0.28% (Mexico). Spain falls in the lower range (1.25%), surpassed by all EU countries. It's logical that the world's most technologically advanced countries invest more in R&D, with Japan (3.21%), the US (3.18%), Germany (3.17%) leading the way. France (2.19%) and the UK (1.71%) fall in intermediate positions. These percentages remain relatively constant over the five analyzed years (2015 to 2019), highlighting the increasing technological gap.

The indicator "% of GDP from private funding spent on R&D" presents an interesting insight: the US, Germany, Japan, and Israel exceed 2% of GDP from private funding. Private investment undoubtedly plays a crucial role in boosting R&D funding, as shown by the indicator "% of GDP from public funding spent on R&D": no country surpasses 1%, and the differences in investment percentages narrow (Spain's results are comparable to the UK, Italy, and Japan).

Looking at gross R&D investment per capita, the results show important differences: Spain (\$522 per capita), the US (\$2,066 per capita), and Germany (\$1,763 per capita).

The three selected indicators for assessing digitization yield very similar results across the analyzed countries. Nonetheless, Spain stands among the top-performing countries: 90.7% of people use the internet (surpassed only by the UK, Japan, and South Korea); the World Economic Forum's score for the "participation in new technologies" indicator is 98.3% (second only to South Korea); however, the University of Notre Dame's "ICT infrastructure index" grants Spain a score of 0.671, surpassed by Germany (0.710), France (0.725), the UK (0.710), and South Korea (0.732).

As previously mentioned, since specific economic investment data for engineering in the analyzed sector and information about the number of engineers and their training related to engineering were unavailable, four OECD indicators were utilized to analyze the state of engineering: regulatory transparency, barriers to competition, restrictions on engineers' movement, and restrictions on entry of foreign engineers. All of these are related to the trade in services restriction index periodically compiled by the OECD. In these indicators, Spain is positioned in an intermediate position among the analyzed countries: good in restrictions on engineers' movement, sufficient in barriers to competition, and insufficient in restrictions on entry of foreign engineers and regulatory transparency.

The global innovation index from the University of Notre Dame was also analyzed. The best results were achieved by Germany, the US, China, and Japan (with the highest score of "1"). Following them are France (0.98), the UK (0.84), and Italy (0.722). Spain falls among the lower-performing countries analyzed (0.128).

The overall evaluation of the Engineering and Innovation criterion awards the highest ratings to the US (9.0), Japan (9.2), followed by Germany (8.2), and Israel (8.0). Spain receives a rating of 5.3, placing it below China (5.8).

4.9. Evaluation of the Complete Water Cycle through objective indicators

The assessment based on the established criteria is as follows:

AGUA IC	Capacidad					Calificación 2019	
	2010	2015	2016	2017	2018

Table 149: Assessment of the Complete Water Cycle sector through objective indicators

The assessment of each country in each year in the overall evaluation has been carried out by using the country's maximum assessment and the corresponding year as a reference (without making any adjustments or limiting the maximum and minimum), to avoid distorting the assessment when data for a certain criterion is not available. This aspect is important to consider, as the overall assessment only considers the criteria for which validated data is available.

In countries where data for a specific criterion is missing and thus not evaluated, the overall sector assessment could either increase or decrease, depending on the result that the unassessed criterion or criteria would yield.

The top-performing countries in the global assessment, considering the established indicators, are France, Japan, and the USA (8.1). Spain, Germany, Italy, the United Kingdom, and Israel have received similar scores (ranging between 7.1 and 6.8).

Spain achieves a good score in Capacity (7.6), Performance (9.1), Operation and Maintenance (8.6), and Safety (8.9).

4.10. Sensitivity analysis based on objective indicators

Se ha realizado un análisis de sensibilidad variando los pesos asignados a cada Criterio. En términos generales, cuando se modifican los pesos de los criterios la evaluación de los países oscila ligeramente, sin alterar sustancialmente la valoración. A continuación, se suministran los resultados alcanzados variando los pesos de las Criterios.

4.10.1. Emphasized weights in Capacity, Performance, and Safety (3); moderate weights in Funding and Adaptation to the future and sustainable development; and Operation and Maintenance (2); low weights in Resilience and Innovation (1)

Table 153: Sensitivity analysis. Emphasized weights on the Criteria: Capacity, Performance, and Safety (2); on the rest of the Criteria (1). Assessment of the Complete Water Cycle

4.11. Conclusions from the assessment based on objective indicators

The best globally evaluated countries considering the established indicators are France, Japan, and the USA (8.1). Spain, Germany, Italy, the United Kingdom, and Israel have received a similar rating (between 7.1 and 6.8).

Spain achieves a good score in Capacity (7.6), Performance (9.1), Operation and Maintenance (8.6), and Safety (8.9).

4.11.1. Capacity Criterion

For the evaluation of this Criterion, seven indicators have been used. The first two analyze the percentage of the population with access to basic drinking water and sanitation services. The third indicator relates the extracted water resources for non-domestic use to the irrigated area's surface. The fourth indicates the percentage of irrigated area in relation to the total area and the percentage of irrigated area in relation to the agricultural land area.

Indicator 6.4.2 of the United Nations' 2030 Agenda defines water stress as the ratio between the total freshwater withdrawn (Total Flow Water Withdrawn) and the total renewable freshwater resources (Total Renewable fresh Water Resources), after considering environmental flow requirements (Ambiental Environmental Flow Requirements). The mathematical definition is: Water stress (%) = TFWW / (TRWR - EFR) * 100 (Variable units: km³/year or 109m³/year). The interpretation of values is as follows: No stress <25%; Low stress: 25%-50%; Medium stress: 50%-75%; High stress: 75%-100%; Critical stress >100%.

From water stress, another indicator is calculated: (100-Water Stress Index) * available water per capita (m³). This indicator represents the water needs of countries.

As observed in the indicator "% of the population with access to basic drinking water services," high values are present. Most developed countries show very high percentages (between 99% and 100%), developing countries range between 95% and 97%, and the least developed countries range between 90% and 95%. India has the lowest value (90%), and China has 95%. All European countries (except Turkey), the USA, and Japan have 100%.

The indicator "% of the population with access to basic sanitation services" also presents high values, albeit lower than the first indicator. India has the lowest percentage (68%), China has 75%, and Peru has 78%. Similar to the previous indicator, European countries, the USA, and Japan have 99%.

These two indicators are considered essential for human development, as recognized by all multinational organizations, and they are a development aid priority.

The indicator "Extracted water resources for non-domestic use/irrigated area (m³/ha)" is representative for analyzing available water for irrigation. Naturally, drier countries generally have a lower available volume, but it's also necessary to consider water extraction and the irrigated area's surface. Thus, Germany, the UK, Peru, Egypt, and Japan have high ratios, while Israel, Spain, France, China, and India show low values.

Regarding the percentage of Irrigated Area/Total Area, India stands out (19.1%), followed by Israel (9.8%), Italy (8.7%), and Spain (7.5%). Naturally, countries with higher rainfall require less irrigated land.

The indicator of water stress is significant. Countries without water stress (values below 25%) include Brazil, Peru, the UK, and France. Countries with critical stress (values over 100%) are Saudi Arabia, Egypt, and Israel. The rest of the countries fall in intermediate values.

Spain performs well concerning the indicator "% Irrigated Area/Total Area" (14.5%), surpassed by Egypt, Japan, India, and Italy.

Overall, Japan has the best evaluation in the Capacity Criterion, followed by a very good assessment for Spain, France, Italy, and the USA. Saudi Arabia, China, India, and Peru have the worst ratings.

4.11.2. Performance Criterion

The indicators selected for this criterion analyze performance, network development level, extent of wastewater treatment, and the needs of the water supply and sanitation systems in countries.

In the indicator "Percentage of the population using safely managed drinking water," the same trend observed in the Capacity indicators can be seen: highly developed countries have very good ratios, while less developed countries have considerably lower values. Mexico and Peru are the worst-rated countries, followed by India, China, and Egypt.

The indicator "Percentage of the population using safely managed sanitation services" follows a similar trend as the previous indicator, although with lower values.

The indicator "Efficiency in water use (USD/m³)/(GDP*10,000) (SDG: 6.4.1) UN" refers to the price of 1 m³ of water paid by users. The United Kingdom stands out with the highest price (87 USD/m³). The lowest prices are found in the USA and Peru (8 USD/m³). Among the analyzed European countries, Spain, along with Italy and Turkey, has the lowest prices.

Indicators that analyze wastewater treatment also exhibit the same differences between developed and developing countries. The percentage of collected wastewater in sewer systems is high in all European countries, USA and Israel (range between 97% and 80%). France stands out with only 82% of collected wastewater for treatment.

Wastewater treatment indicators (primary, secondary, and tertiary) provide detailed insight into treatment quality, although only the indicator related to tertiary treatment is evaluated: "% of the population connected to a tertiary wastewater treatment plant (OECD)."

The overall assessment of the Performance criterion is excellent in the USA, the United Kingdom, and Spain, followed by European countries, Israel, and Japan.

4.11.3. Financing Criterion

The financing of infrastructure is an essential criterion for evaluating the quality of infrastructure and encompasses two distinct elements: investment for infrastructure creation and investment for conservation, operation, and maintenance. In countries where the Complete Water Cycle infrastructure is mature, less overall investment is allocated compared to countries where it is being established. Consequently, a significant percentage is directed towards conservation relative to creation. Conversely, in countries where infrastructure is still being established and

under development, the investment in creating infrastructure is crucial compared to investment in conservation. Unfortunately, separating investment for creation from investment for conservation is not straightforward.

One of the most representative indicators is the investment in the Complete Water Cycle relative to the national GDP. The evolution of this indicator over the years provides valuable insights into the country's infrastructure development level and its conservation status. A high percentage of GDP (above 0.7% or 0.8%) indicates that the Complete Water Cycle is in the process of being established. Generally, if this percentage drops below 0.4%, it suggests that no new infrastructure is being created. Moreover, if this percentage falls below 0.2-0.3%, it's an indication that the investment also inadequately covers the needs for conservation, maintenance, and management of the infrastructure.

The "Investment Needs" ratio is defined as the percentage of the population without safe drinking water management multiplied by the percentage of the population without safe sanitation management. This ratio has been used to apply it to the Complete Water Cycle expenditure as a percentage of GDP and the total expenditure per capita to consider the effect of the development level of the full cycle network for evaluating investment.

Data on "Complete Water Cycle expenditure" and "Operation and Maintenance Expenses" have been collected from the organization "GLOBAL WATER INTELLIGENCE" (GWI), albeit indirectly (through the Confederation of Danish Industry, an organization linked to GWI that uses GWI's data).

Regarding investment in the Complete Water Cycle as a % of GDP, the average value among analyzed countries is 0.39%, with a maximum of 0.91% reached in 2019 by Egypt. Spain has a low value, 0.16% of GDP in 2019, the lowest among the analyzed European countries. The highest value in 2019 is seen in Egypt and Japan (0.91% and 0.66%, respectively). Among European countries, Turkey (0.46), France (0.44%), and the UK (0.36%) are the top investors.

Some interesting insights from the used indicators are summarized in the following table:

Indicator	Average	Min Value	Max Value
% of total WATER cycle expenditure relative to GDP	0,39%	0,15%	0,91%
Total WATER cycle sector expenditure per capita	89\$	11\$	267\$
Investment needs	0,311	0,021	0,81

The significant dispersion of the results presented in the previous table reflects a reality: countries that, during the analyzed years in the report (2015-2019) are creating new infrastructure or undergoing significant transformation in their networks show high values. This indicates a substantial commitment to the development and improvement of the full WATER cycle network.

The "Investment Needs"⁹ ratio shows widely varying values. For instance, it becomes evident that Mexico, Peru, and India require substantial investments; conversely, both Germany and the United Kingdom, along with Israel, the USA, and Spain, require fewer investments.

Spain receives a highly sufficient score in this Criterion (6.0), similar to the scores obtained by European countries (France stands out with 7.2). Israel achieves the highest score (10). The lowest scores are obtained by Mexico, Peru, and India.

4.11.4. Adaptation to the Future and Sustainability Criterion

To analyze this criterion, OECD data related to countries' freshwater resources has been utilized. Among these, the following have been selected: evapotranspiration (m³/capita), renewable freshwater (m³/capita), and gross freshwater extraction (long-term annual average) (m³/capita). Using these values, the percentage of gross freshwater extraction in relation to the total renewable freshwater has been calculated. This last indicator demonstrates the countries' vulnerability in terms of freshwater.

The University of Notre Dame (Indiana, USA) has been developing an indicator known as "ND-Gain" for several years. This indicator assesses how countries are adapting to climate change and environmental sustainability in relation to water use. It reveals the vulnerability of countries to climate change impacts while also evaluating their readiness to leverage public and private sector investments applied to climate change adaptation actions. The ND-Gain index compiles over 74 variables to form 45 core indicators measuring the vulnerability and readiness of 192 UN countries from 1995 to the present (due to data availability, ND-Gain assesses vulnerability for 182 countries and readiness for 184 countries). Among the ND-Gain index indicators, five related to water have been selected:

Proyección del cambio en la escorrentía anual (ND-GAIN Water Index.)
Proyección del cambio en la recarga anual de aguas subterráneas. (ND-GAIN Water Index.)
Tasa de extracción de agua dulce. (ND-GAIN Water Index. Fresh water withdrawal rate)
Ratio de dependencia del agua originada en el exterior de sus fronteras. (ND-GAIN Water Index)
Capacidad de presas. (ND-GAIN Water Index. Dam capacity)

The first indicator depicts the effects that climate change will have on runoff water resources by mid-century. It's expressed as the percentage change in annual runoff from the reference projection (1990-2009) to the future projection (2040-2069).

The second indicator illustrates how climate change will impact annual groundwater resources.

The third pertains to the assessment of total actual renewable water resources (including desalinated water).

The fourth evaluates the dependence on total renewable water resources originating from outside the country.

The fifth assesses the capacity to adapt to variations in water distribution (both temporal and geographical). It measures a country's per capita dam storage capabilities in the face of changes

⁹ Investment needs = % of the population without safe drinking water management × % of the population without safe sanitation management

in freshwater resources, including the effects of climate change (including surface and groundwater entering the country or secured through bilateral treaties).

In the indicator measuring evapotranspiration per capita, Israel stands out with a ratio of 431 m³/capita, much lower than the rest of the countries with available data (Brazil, Peru, Egypt, Saudi Arabia, China, and India are not evaluated). Among the analyzed European countries, Spain has the highest evapotranspiration (4,805 m³/capita).

Renewable freshwater resources per capita (long-term annual average) show similar results across all European countries (around 2,400 m³/capita). The United States stands out with 7,521 m³/capita. Israel has the lowest value (307 m³/capita).

In the indicator measuring freshwater extraction per capita, Spain unfavorably stands out (633 m³/capita). The USA has the highest ratio (1,207 m³/capita), double that of European countries. Israel extracts the least (129 m³/capita), and Egypt and Saudi Arabia are likely in a similar situation, although data is not available.

Regarding the University of Notre Dame (ND-GAIN) indicators, they show high vulnerability for most countries, although with different ratings depending on the indicator. The following table presents the results of these indicators in relation to those obtained for Spain:

Vulnerability Indicator ND-Gain	Max (1,00 worst)	Min (0,00 best)	Spain
Projection of change in annual runoff	0,87	0,40	0,45
Projection of change in annual groundwater recharge	0,32	0,13	0,19
Rate of freshwater extraction	1,00	0,01	0,24
Ratio of dependence on externally generated water	0,98	0,00	0,00
Dam capacity	0,99	0,15	0,72

Spain stands out in the ratio of dependence on water and dam capacity. In terms of water dependence, Spain's situation is evident: all of its water resources are generated within its own borders, not relying on any rivers originating outside its territory. In dam capacity, the indicator presents the best result after Brazil (due to the dams in the Amazon), Egypt (the Nile's dams, especially the Aswan Dam), and the USA (owing to the high regulation capacity of its large rivers).

In the percentage of technologies related to water treatment and purification, Spain receives an average rating. Mexico and Brazil achieve the highest ratings in this category.

In the indicator measuring the percentage of freshwater extraction relative to renewable freshwater, Spain (along with Turkey) presents a very high ratio (27%), surpassed only by Israel (41.9%). This result has a significant implication: Spain's ability to extract more water than it has available is limited compared to other countries. This implies that Spain must pay careful attention to and manage water consumption in the future.

In the final index of adaptation to the future and sustainable development, Brazil receives the highest rating (7.8). Spain's rating is similar to the analyzed European countries (6.6 within the range of 5.8-7.0). The lowest ratings are attributed to countries in Africa: Saudi Arabia (0.6), Egypt (2.7), and Israel (3.9). India also receives an inadequate rating (4.1).

4.11.5. Operation and Maintenance Criterion

Similarly to what was discussed regarding the Financing Criterion, the percentage of GDP allocated to conservation represents an indicator that can guide the appropriateness of investment for conservation needs. To provide additional context for this indicator, investment per capita has also been considered.

Reliability in water supply is related to good conservation and maintenance practices. To assess this parameter, the "Water Supply Reliability" indicator from the World Economic Forum's Global Competitiveness Index (GCI) has been used.

The most significant ratio for evaluating the Operation and Maintenance Criterion is the percentage of investment in operation and maintenance relative to the asset value. However, obtaining this value for the entire WATER cycle infrastructure is not feasible. Therefore, the investment in operation and maintenance relative to GDP has been utilized, although it couldn't be obtained for all countries. The average value for the ratio "% Water Sector Operation and Maintenance Expenses / Real GDP" is 0.62%, with a maximum of 1.3% and a minimum of 0.28%, corresponding to India. Spain has a percentage of 0.83%.

Another indicative ratio is the percentage of investment in operation and maintenance relative to the population. The resulting average value is \$168, while the maximum is \$453 and the minimum is \$5. Spain's value is \$244.

Regarding the "Water Supply Reliability" indicator from the Global Competitiveness Index by World Economic Forum, Spain, France, the United Kingdom, Israel, and Japan have the best results (over 90 out of 100).

In the entirety of the Operation and Maintenance Criterion, Spain is rated very well (8.6). The countries with the highest ratings are France and Japan (10), while the countries with lower ratings are India, China, and Mexico.

4.11.6. Safety Criterion

For the evaluation of this criterion, OECD indicators related to premature deaths per million inhabitants due to unsafe water supply, inadequate sanitation, and lack of access to safe handwashing facilities have been utilized.

The indicator "Premature deaths per million inhabitants (unsafe water source) (OECD)" has an average of 33 fatalities, with significant variations among countries: ranging from a minimum of 2 deaths in all European countries, the USA, and Israel, to a maximum of 372 deaths in India. Spain's value is 1.11, which ranks among the best-performing countries.

The second indicator analyzed, "Premature deaths per million inhabitants (unsafe sanitation) (OECD)", exhibits values in line with the first indicator. The standout performers in this category are the United Kingdom (0.12) and Spain (0.27), while India reports the highest value (213). A similar situation is observed in the third indicator, "Premature deaths per million inhabitants (lack of access to safe handwashing) (OECD)."

Overall, the best-performing countries are the European nations, the USA, and Israel, with slight differences among them. India stands as the worst-performing country, showing a significant gap compared to the rest. Following India, there is a considerable distance before Mexico, Brazil, Peru, and Egypt, which are notably worse-off compared to the top-rated countries.

4.11.7. Resilience Criterion

For the evaluation of this criterion, indicators have been chosen that indirectly provide some indication of the resilience of the entire water cycle sector.

For example, water availability per capita indicates vulnerability and capacity to respond to water supply issues in situations of drought or water scarcity. The assessment of renewable freshwater resources per agricultural land area, corrected for water stress, also provides information about the agricultural sector's ability to respond to freshwater scarcity phenomena.

The Sustainable Development Goal 6.5.1 indicator "% of integrated water resource management" can determine whether centralized management is possible in the face of adverse conditions. Centralized management enables the establishment of contingency plans and comprehensive actions in emergency situations affecting all processes within the entire water cycle. Highly decentralized management may hinder cohesive response efforts.

The last considered indicator is the percentage of freshwater extraction for domestic use relative to total freshwater extraction. This indicator evaluates available resources for domestic use during periods of scarcity.

The highest overall rating for this criterion is achieved by Japan (10.0), followed by France (9.6) and the USA (9.4), with European countries including Spain (6.9) following suit. The least well-performing countries are Egypt, Israel, and Saudi Arabia.

4.11.8. Engineering and Innovation Criterion

With regards to innovation, three OECD patent indicators have been identified: the number of patents related to treatment and purification, those related to water pollution reduction, and those related to desalination, all per million inhabitants.

Despite efforts to gather more specific data related to the entire water cycle infrastructure sector, reliable and verifiable data has been scarce. As a result, the approach taken is to analyze the overall state of research, development, and innovation (RDI) in different countries, assuming these data points can provide insights into the state of the entire water cycle. For this purpose, the indicators and data from the "Main Science and Technology Indicators, Volume 2021" published by the OECD in 2022 have been selected. This comprehensive report provides a set of indicators reflecting the level and structure of efforts made by OECD member countries and other non-member countries (Argentina, People's Republic of China, Romania, Russian Federation, Singapore, and South Africa) in the field of science and technology. These indicators cover resources dedicated to research and development, patent families, and international trade in R&D-intensive industries.

The Global Innovation Index from the University of Notre Dame (ND-Gain index) has also been considered.

To analyze the progress of digitalization, three indicators have been included: Participation in New Technologies (GCI -WEF-), ICT Infrastructure Index (ND-Gain Index, ICT infrastructure), and the number of people using the internet.

For assessing the state of engineering in the water cycle sector, it would have been useful to have precise information about the education and training of water cycle engineers, the number of engineers engaged in the design, construction, conservation, and management of the water cycle

per unit of economic investment, and economic data related to engineering investment compared to investment in the construction, conservation, operation, and management of water cycle networks. However, such specific data was not available, so four OECD indicators related to engineering have been considered. These indicators cover regulatory transparency, barriers to competition, restrictions on the movement of engineers, and restrictions on the entry of foreign engineers. All of these are included in the OECD's periodic index of trade in services restrictions.

The OECD indicators related to research and development show the global strategic position of countries in all sectors of the economy with respect to research.

For example, the indicator "% of GDP spent on gross domestic expenditure on R&D" for the analyzed countries shows a broad spectrum, ranging from a maximum of 3.21% (Japan) to a minimum of 0.28% (Mexico). Spain falls within the lower range at 1.25%, lower than all EU countries. It's logical that the world's technologically advanced countries invest more in R&D: Japan (3.21%), USA (3.18%), and Germany (3.17%). France (2.19%) and the United Kingdom (1.71%) fall in an intermediate position. These percentages remain relatively constant over the five years analyzed (2015 to 2019), which emphasizes the growing technological gap.

The indicator "% of GDP funded by the private sector for R&D" provides an interesting insight: the USA, Germany, Japan, and Israel exceed 2% of GDP in private sector funding. Clearly, private impetus is a determining factor in increasing R&D funding, as indicated by the "% of GDP funded by the public sector for R&D" indicator. None of the countries surpass 1% in this regard, and the percentage investment differences are narrowing (Spain's results are comparable to those of the United Kingdom, Italy, and Japan).

Regarding gross R&D investment per capita, the results show significant differences: Spain (\$522 per capita), USA (\$2,066 per capita), and Germany (\$1,763 per capita).

The three selected indicators for assessing digitalization show very similar results among the analyzed countries. However, Spain ranks among the top countries: 90.7% of people use the internet (surpassed only by the United Kingdom, Japan, and South Korea); the score given by the World Economic Forum for the "participation in new technologies" indicator is 98.3% (surpassed only by South Korea); yet, the University of Notre Dame's "ICT infrastructure index" rates Spain at 0.671, surpassed by Germany (0.710), France (0.725), the United Kingdom (0.710), and South Korea (0.732).

As previously mentioned, specific economic data on engineering investment within the analyzed sector and the number of engineers and their training related to engineering weren't available. Thus, four OECD indicators related to engineering were employed to assess the state of engineering. Spain ranks in an intermediate position among the analyzed countries: very good in terms of restrictions on the movement of engineers, sufficient in terms of barriers to competition, and insufficient regarding restrictions on the entry of foreign engineers and regulatory transparency. The overall innovation index from the University of Notre Dame was also analyzed. Germany, USA, China, and Japan achieved the best results (with a maximum score of "1"). Next in line are France (0.98), the United Kingdom (0.84), and Italy (0.722). Spain falls among the lowest-performing countries analyzed (0.128).

The overall evaluation of the Engineering and Innovation criterion assigns the highest ratings to the USA (9.0) and Japan (9.2), followed by Germany (8.2) and Israel (8.0). Spain receives a rating of 5.3, below that of China (5.8).

5. Qualitative evaluation. Expert surveys

As described in the methodology employed by Asociación Caminos, once the objective indicators have been obtained (which have served as the basis for the objective evaluation of the sector in comparison with selected countries), a series of questions have been formulated (grouped into the eight analyzed Criteria) for their assessment on the same scale as the objective indicator ratings. The posed questions include the possibility of providing comments and suggestions within each Criteria group, aiming to gather insights that experts might consider relevant and which are not covered by the objective indicators or the presented questionnaire.

These questions have been directed to a group of experts selected by Asociación Caminos. The survey has been transformed into a Google form to facilitate analysis and the integration of results.

The questionnaire sent to the experts includes two complementary questions:

- What infrastructure needs do you believe are necessary for the Water Cycle in Spain for the next 10 years, both globally and in various domains?
 - a) Global
 - b) Regulation Works (dams and reservoirs)
 - c) Desalination Stations
 - d) High Conduits
 - e) Drinking Water Treatment Plants
 - f) Low Networks
 - g) Wastewater Treatment Plants
- In what approximate amount do you quantify the necessary investment to develop the infrastructure needs in the Water Cycle in Spain for the next 10 years, both globally and in various domains?
 - a) Global
 - b) Regulation Works (dams and reservoirs)
 - c) Desalination Stations
 - d) High Conduits
 - e) Drinking Water Treatment Plants
 - f) Low Networks
 - g) Wastewater Treatment Plants

Given that the questions in the survey are quite generic (evaluating the public works sector in Spain as a whole), it is difficult to provide precise numeric qualitative ratings. Therefore, a non-numeric qualitative rating is requested. However, to integrate the results achieved with the objective numerical indicators, a numerical assignment is subsequently applied to each qualitative rating.

Rating system of Asociación Caminos							
Asociación Caminos	VERY INSUFFICIENT	INFUFFICIENT	SUFFICIENT	HIGHLY SUFFICIENT	GOOD	VERY GOOD	EXCELLENT
	F	FX	E	D	C	B	A

Table 154: Qualitative evaluation rating system by the experts

Rating	Numerical Assignment
Excellent	9,5
Very good	8,5
Good	7,5
Highly sufficient	6,5
Sufficient	5,5
Insufficient	4,0
Very insufficient	2,0
Insufficient criterion or no response	-

Table 155: Numerical assignment of qualitative evaluation by experts

In a schematic way, the evaluation process for each sector is as follows:

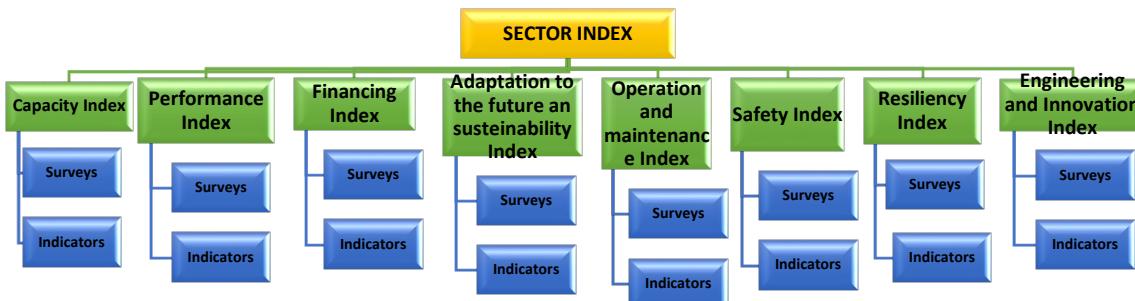

Figure 9: Scheme of the evaluation system for public works sectors

Once the responses have been obtained, the results achieved have been analyzed, combining them with the results obtained through the objective indicators.

In general¹⁰, a weighting is established for each Criterion between the quantitative indicators (expressed by objective indicators) and the qualitative evaluation from experts to obtain the Criterion Index, in the following proportions:

A. Quantitative evaluation of each Criterion: 50%

B. Qualitative evaluation of each Criterion by experts through surveys, questionnaires, and opinions 50%

¹⁰ In some sectors, such as Ports, there is the possibility of modifying this weighting due to the difficulty of quantitative indicators accurately reflecting the reality of the sector.

5.1. Survey for expert evaluation

A total of 33 responses have been obtained with the following results.

5.1.1. Capacity

Peso	EVALUACIÓN DE CAPACIDAD (Encuestas a expertos) (Max 10)			
1	1.1. ¿Cómo valora la cobertura del territorio de la red de abastecimiento de agua potable?	7,9	BIEN	C
1	1.1. ¿Cómo valora la cobertura del territorio de la red de abastecimiento de agua potable?	6,3	SUFICIENTE ALTO	D
1	1.3. Teniendo en cuenta las características de la población en España y la fuerte estacionalidad de las precipitaciones en muchas zonas, ¿cómo valora la capacidad de las instalaciones del Ciclo del Agua en España para atender las demandas actuales?	6,1	SUFICIENTE ALTO	D
1	1.4. Teniendo en cuenta las características de la población en España, la fuerte estacionalidad de las precipitaciones en muchas zonas, y los posibles efectos de los fenómenos asociados al cambio climático en un futuro próximo, ¿cómo valora la capacidad de las instalaciones del Ciclo del Agua en España para atender las demandas en el horizonte de los próximos 10 años?	5,4	SUFICIENTE	E
4	TOTAL EVALUACIÓN CAPACIDAD POR LOS EXPERTOS:	6,4	SUFICIENTE ALTO	D

Table 156: Expert assessment of capacity

Comments, suggestions, and recommendations from the experts

- The situation of industrial and agricultural supply varies widely by regions; domestic supply is more stable. In each region, infrastructure development and alternative goals need to be pursued.
- In my region (Mediterranean area), there is a permanent scarcity situation, but for the most part, the infrastructure exists. However, this year it's becoming clear that in areas not accustomed to scarcity, the necessary preparations haven't been made, and there isn't enough resilience and flexibility.
- Additionally, excessive political control over water tariffs results in tariffs that don't cover the necessary infrastructure renewal costs, leading to increasing deterioration.
- Climate change will require greater frugality in consumption.
- There shouldn't be problems in meeting urban water demand.
- The situation is adequate, but continuous maintenance of existing infrastructure, which is deteriorating, is necessary.
- While the capacity to meet supply demands is generally positive, it shouldn't be forgotten that often this comes at the cost of overexploiting rivers and aquifers, resulting in corresponding environmental impacts.
- Despite this, there are also current deficit situations and uncertainties about the capacity of current systems, particularly concerning agricultural demand.
- Not all territories have the same situation; some areas have adequate capacity, while others are insufficient.

- There is no hydraulic policy or planning in this country.
- Spain is very diverse; there are areas where demands are currently met without problems and will be met in 10 years, while others already face deficits that will worsen.
- I believe storage capacity of surface water and regulation in Mediterranean basins should be increased.
- The territory considered is where I reside; the situation differs in other relatively nearby areas.
- In the domestic sector, changing the local government framework law by assigning competencies to supra-municipal bodies aligned with the optimal management scope and separated from municipal political decisions. In the industrial and irrigation sectors, reviewing the concessionary system, cost recovery principles, and legal changes to promote public-private participation.
- Realistic planning considering the increasing occurrence of drought periods and occasional excess water events.
- Decouple water tariffs from political decisions as much as possible and ensure they truly cover costs.
- Strictly adhere to planned timelines.
- Expand the sewage network. Control pollution during rain episodes.
- Increase reservoir capacity, interconnect basins and surface-water and groundwater systems.
- Upcoming supply issues (especially in irrigation) for which reuse and desalination will be key.
- More reservoirs and/or increased investment in desalination are needed.
- The situation of systems currently causing overexploitation of surface or groundwater resources should be reviewed and corrected.
- In any case, new irrigation should not be authorized without guaranteed viability in terms of water, economic, and environmental factors, at both national and regional levels.
- There should be an exclusive ministry for water.
- There are many areas to progress in (river regulations, advancing reuse, improving network efficiency, etc.). In my opinion, the most urgent is progressing in the regulation of basins that have surpluses (typically in winter), such as the Órbigo and Carrión basins in the Duero region, although others could also be improved.

5.1.2. Performance

Peso	EVALUACIÓN DE PRESTACIONES (Encuestas a expertos) (Max 10)			
1	2.1. ¿Cómo valora la calidad del agua para consumo en España?	8,1	MUY BIEN	B
1	2.2. En relación con otros países de nuestro entorno, ¿cómo valora los sistemas de control de la calidad del agua para abastecimiento en España?	7,8	BIEN	C
1	2.3. ¿Cómo valora la capacidad de regulación existente en España (presas, depósitos, interconexión de cuencas, etc.)?	6,5	SUFICIENTE ALTO	D
1	2.4. ¿Cómo valora las interconexiones existentes entre cuencas?	5,1	SUFICIENTE	E
1	2.5. De forma global, ¿cómo valora la atención al público y la gestión de incidencias de los operadores del sector del agua en España?	6,4	SUFICIENTE ALTO	D
5	TOTAL EVALUACIÓN DE PRESTACIONES POR LOS EXPERTOS:	6,8	SUFICIENTE ALTO	D

Table 157: Expert assessment of Performance

Comments, suggestions, and recommendations from the experts

- The consumption of tap water should be encouraged, with prior investment - if necessary - in quality improvement infrastructure. The excessive use of bottled water, often without reason and with exorbitant cost, should be minimized, especially in the Levante region. Local municipalities refusing even minimal tariff increases for quality improvement contribute to this issue.
- The concept of water as a public good is not respected; it is considered territorial, making interconnections practically impossible.
- Depopulated and inland areas of Spain face significant difficulties in maintaining a good service.
- Private management for low supply should continue, as it is more efficient with strict regulation. On the other hand, high-level management by basin authorities proves capable of responding to challenges.
- Regardless of the mentioned current situations of overexploitation in the previous chapter, localized supply problems, current or foreseeable in the future, will always require specific solutions. This includes the high-value-added Mediterranean agriculture.
- Moreover, it is worth noting that the present questionnaire does not explicitly refer to groundwater exploitation systems, which contribute a considerable percentage of supplies. These systems gain special importance during drought situations.
- There is no hydraulic policy in this country.
- It is a mistake to consider water as a political tool for conflict between different communities.

5.1.3. Financing

Peso	EVALUACIÓN DE FINANCIACIÓN (Encuestas a expertos) (Max 10)			
1	3.1. ¿Considera suficiente la inversión actual en las instalaciones del ciclo del agua en España(embalses, desaladoras, otras obras de captación, ETAPS, EDARS, instalaciones de reutilización, etc.)?	4,3	INSUFICIENTE	FX
1	3.2. ¿Cómo valora la robustez de las actuales fuentes de financiación de las obras que tienen relación con el Ciclo del Agua?	4,7	INSUFICIENTE	FX
1	3.3. ¿Cómo considera que se está gestionando la inversión en las obras del Ciclo del Agua?	5,1	SUFICIENTE	E
1	3.4. ¿Cómo considera la actual participación de la inversión privada en el proyecto, construcción y/o explotación de las obras del Ciclo del Agua en España?	5,1	SUFICIENTE	E
4	TOTAL EVALUACIÓN FINANCIACIÓN POR LOS EXPERTOS:	4,8	INSUFICIENTE	FX

Table 158: Expert assessment of Financing

Comments, suggestions, and recommendations from the experts

- There is significant interest in investing in water cycle-related projects in Spain, but the legal and regulatory framework impedes or complicates these efforts.
- Public-private collaboration is very complex due to the current legal framework and continuous suspicion. There is a total lack of flexibility and clarity in approaches to such collaboration.
- Rural and urban Spain show significant differences.
- Necessary infrastructure to comply with the Water Framework Directive is still incomplete.
- The lack of funding in the sector is highly concerning, particularly for the conservation and maintenance of infrastructure. There is also insufficient private investment.
- There is no legal way (risk-sharing, etc.) to access private investments.
- There is an evident deficiency in urban water cycle treatment, as well as low cost recovery from users, more pronounced in the agricultural sector.
- Water should not become a business; that cannot be the objective.
- Replace and modify the regulatory framework (as previously mentioned, shifting competencies away from municipal jurisdiction) to promote public-private participation. Currently, except for concessions, private investment in public projects is impossible.
- Water should cover its own costs.
- Complete sanitation and treatment infrastructure.
- Reflect on existing fees and tariffs to ensure proper maintenance of existing systems and financing for new ones, including construction and private investment for operation due to limited public funding.
- Legislative changes in PPP-type contracts (which currently do not exist).
- Consequently, investment in treatment should be increased, and cost recovery policies applied, including modifying the economic regime under the Water Law.

- It should finally be accepted and passed on, in accordance with EU regulations, that the actual cost of water and the amortization of investments made and yet to be made should be covered, allowing private capital to enter investment, not just system operation.

5.1.4. Adaptation to the Future and Sustainability

Peso	EVALUACIÓN DE ADAPTACIÓN AL FUTURO Y DESARROLLO SOSTENIBLE (Encuestas a expertos) (Max 10)			
1	4.1. ¿Considera que los instrumentos de planificación hidrológica en vigor tienen en cuenta la adaptación a las demandas futuras de los usuarios?	5,9	SUFICIENTE	E
1	4.2. ¿Considera que la Planificación Hidrológica es coherente y dispone de las herramientas de financiación e inversión para llevarla a la práctica?	4,5	INSUFICIENTE	FX
1	4.3. ¿Cómo evaluaría la adaptación de las obras del Ciclo del Agua en España a la protección del medio ambiente en cuanto al cumplimiento de la legislación vigente, incluyendo la Directiva Marco del Agua?	6,1	SUFICIENTE ALTO	D
1	4.4. ¿Cómo valora las acciones que se están tomando para reducir el impacto ambiental de las obras del Ciclo del Agua en España?	6,6	SUFICIENTE ALTO	D
1	4.5. ¿Cómo valora la exigencia ambiental en las obras del Ciclo del Agua en España en relación con otro tipo de infraestructuras?	6,8	SUFICIENTE ALTO	D
1	4.6. ¿Cómo valora la eficiencia de las instalaciones de regadío en cuanto al ahorro de agua en España?	5,5	SUFICIENTE	E
1	4.7. ¿Cómo valora las acciones que se están tomando para reducir el consumo de CO2 en la infraestructura Ciclo completo del Agua?	6,1	SUFICIENTE ALTO	D
1	4.8. ¿Cómo considera la adaptación de la infraestructura del Ciclo completo del agua a los efectos del cambio climático?	5,8	SUFICIENTE	E
8	TOTAL EVALUACIÓN ADAPTACIÓN AL FUTURO Y DESARROLLO SOSTENIBLE POR LOS EXPERTOS:	5,9	SUFICIENTE	E

Table 159: Expert assessment of Adaptation to the Future and Sustainability

Comments, suggestions, and recommendations from the experts

- Non-public financing tools do not exist (as previously mentioned). I believe that environmental impact reduction is sufficient (in fact, it's slowing down many interesting projects). However, adaptation to climate change is insufficient, not only in the Levant, a traditional drought-prone area. Increasingly frequent drought issues are arising in the Cantabrian region due to unpreparedness and lack of investment. In the Levant, there's a need for more investment in alternative resources like desalination, and in large irrigable areas inland, added value for irrigators should be promoted to keep them in the territory.
- In terms of demand, efficiency in irrigation is crucial.
- The alignment of hydrological planning with the environment has an ideological bias inconsistent with data rigor, especially regarding irrigation. There's a significant gap between necessary investment in treatment and the projected, affecting the achievement of the Water Framework Directive.
- The uncertainties in the agricultural sector and the inadequate cost recovery, as mentioned in previous sections, are worth remembering.

- Regarding environmental variables, it's important to note the previously discussed issues of overexploitation, and generally emphasize how far our water bodies, both surface and groundwater, are from achieving the "good status" envisioned by the Water Framework Directive.
- On another note, the rating of "insufficient" in section 4.5 should not be understood to imply that other types of infrastructure are better environmentally protected; frequently, it may be the opposite due to greater social insensitivity in those cases. .

5.1.5. Operation and Maintenance

PESO	EVALUACIÓN DE OPERACIÓN Y MANTENIMIENTO (Encuestas a expertos) (Max 10)			
1	5.1. ¿Cómo valora la inversión en conservación y mantenimiento de las instalaciones del Ciclo del Agua en España en los diferentes ámbitos? [Estaciones depuradoras]	5,2	SUFICIENTE	E
1	5.2. ¿Considera que los medios aplicados a la operación, conservación y mantenimiento de las instalaciones del Ciclo del Agua son los adecuados para atender las demandas de los usuarios en los diferentes ámbitos? [Obras de regulación (presas y embalses)]	4,8	INSUFICIENTE	FX
1	5.3. ¿Considera que los medios aplicados a la operación, conservación y mantenimiento de las instalaciones del Ciclo del Agua son los adecuados para atender las demandas de los usuarios en los diferentes ámbitos? [Estaciones desaladoras]	6,3	SUFICIENTE ALTO	D
1	5.4. ¿Considera que los medios aplicados a la operación, conservación y mantenimiento de las instalaciones del Ciclo del Agua son los adecuados para atender las demandas de los usuarios en los diferentes ámbitos? [Conducciones en alta]	6,1	SUFICIENTE ALTO	D
1	5.5. ¿Considera que los medios aplicados a la operación, conservación y mantenimiento de las instalaciones del Ciclo del Agua son los adecuados para atender las demandas de los usuarios en los diferentes ámbitos? [Estaciones potabilizadoras]	6,3	SUFICIENTE ALTO	D
1	5.6. ¿Considera que los medios aplicados a la operación, conservación y mantenimiento de las instalaciones del Ciclo del Agua son los adecuados para atender las demandas de los usuarios en los diferentes ámbitos? [Redes de baja]	5,4	SUFICIENTE	E
1	5.7. ¿Considera que los medios aplicados a la operación, conservación y mantenimiento de las instalaciones del Ciclo del Agua son los adecuados para atender las demandas de los usuarios en los diferentes ámbitos? [Estaciones depuradoras]	5,3	SUFICIENTE	E
1	5.8. ¿Cómo valora el estado de conservación y mantenimiento de las obras del Ciclo del Agua en España en los diferentes ámbitos? [Obras de regulación (presas y embalses)]	4,9	INSUFICIENTE	FX
1	5.9. ¿Cómo valora el estado de conservación y mantenimiento de las obras del Ciclo del Agua en España en los diferentes ámbitos? [Estaciones desaladoras]	6,7	SUFICIENTE ALTO	D
1	5.10. ¿Cómo valora el estado de conservación y mantenimiento de las obras del Ciclo del Agua en España en los diferentes ámbitos? [Conducciones en alta]	6,0	SUFICIENTE ALTO	D
1	5.11. ¿Cómo valora el estado de conservación y mantenimiento de las obras del Ciclo del Agua en España en los diferentes ámbitos? [Estaciones potabilizadoras]	6,3	SUFICIENTE ALTO	D
1	5.12. ¿Cómo valora el estado de conservación y mantenimiento de las obras del Ciclo del Agua en España en los diferentes ámbitos? [Redes de baja]	5,1	SUFICIENTE	E
1	5.13. ¿Cómo valora el estado de conservación y mantenimiento de las obras del Ciclo del Agua en España en los diferentes ámbitos? [Estaciones depuradoras]	5,2	SUFICIENTE	E
13	TOTAL EVALUACIÓN OPERACIÓN Y MANTENIMIENTO POR LOS EXPERTOS:	5,7	SUFICIENTE	E

Table 160: Expert assessment of Operation and Maintenance

Comments, suggestions, and recommendations from the experts

- Each of the areas has a distinct management structure.
- Dams and especially canals are aging without proper replacement and maintenance.
- It's a consequence of the previously answered questions.
- Conservation requires investments that are not being carried out. Maintenance is relatively well managed by operators of different facilities within their capacities.
- It's difficult to differentiate among the three types of questions.
- The situation varies greatly depending on whether it's the agricultural or urban sector, and within the urban sector, based on the population size of the system.
- In this country, there is no planning.
- Establishing permanent auditing systems that trigger automatic mechanisms is necessary.
- Financial increase in human resources and conservation and maintenance.
- Greater investment for conservation, as demanded by AEAS for years.
- Regarding the urban sector, promoting the creation of systems or associations large enough to ensure technical, economic, and environmental viability is essential.
- Regarding irrigation, emphasizing modernization policies as previously mentioned is important.
- Regarding state and regional high-level infrastructures, they must be a priority, and in general, investment in operation and maintenance needs significant reinforcement.
- From another perspective, surveillance and control of the water domain by Public Administrations is essential to ensure proper operation and maintenance of surface and groundwater supply systems.

5.1.6. Safety

Peso	EVALUACIÓN DE SEGURIDAD (Encuestas a expertos) (Max 10)			
1	6.1. ¿Cómo valora las medidas de control existentes para garantizar el abastecimiento de agua a la población en España?	6,9	SUFICIENTE ALTO	D
1	6.2. ¿Cómo valora, desde el punto de vista de la seguridad sanitaria, la extensión y calidad de la depuración de las aguas residuales?	6,0	SUFICIENTE ALTO	D
1	6.3. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques físicos en los diferentes ámbitos? [Global]	5,7	SUFICIENTE	E
1	6.4. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques físicos en los diferentes ámbitos? [Obras de regulación (presas y embalses)]	5,5	SUFICIENTE	E
1	6.5. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques físicos en los diferentes ámbitos? [Estaciones desaladoras]	6,2	SUFICIENTE ALTO	D
1	6.6. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques físicos en los diferentes ámbitos? [Conducciones en alta]	6,1	SUFICIENTE ALTO	D
1	6.7. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques físicos en los diferentes ámbitos? [Estaciones potabilizadoras]	6,0	SUFICIENTE ALTO	D
1	6.8. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques físicos en los diferentes ámbitos? [Redes de baja]	5,5	SUFICIENTE	E
1	6.9. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques físicos en los diferentes ámbitos? [Estaciones depuradoras]	5,8	SUFICIENTE	E
1	6.10. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques de tipo lógico (ciberseguridad) en los diferentes ámbitos? [Global]	4,9	INSUFICIENTE	FX
1	6.11. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques de tipo lógico (ciberseguridad) en los diferentes ámbitos? [Obras de regulación (presas y embalses)]	4,8	INSUFICIENTE	FX
1	6.12. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques de tipo lógico (ciberseguridad) en los diferentes ámbitos? [Estaciones desaladoras]	5,1	SUFICIENTE	E
1	6.13. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques de tipo lógico (ciberseguridad) en los diferentes ámbitos? [Conducciones en alta]	5,2	SUFICIENTE	E
1	6.14. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques de tipo lógico (ciberseguridad) en los diferentes ámbitos? [Estaciones potabilizadoras]	4,9	INSUFICIENTE	FX
1	6.15. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques de tipo lógico (ciberseguridad) en los diferentes ámbitos? [Redes de baja]	4,8	INSUFICIENTE	FX
1	6.16. De forma global, ¿cómo valora la seguridad de las instalaciones del Ciclo del Agua en España frente a ataques de tipo lógico (ciberseguridad) en los diferentes ámbitos? [Estaciones depuradoras]	4,8	INSUFICIENTE	FX
1	6.17. ¿Considera que se están tomando medidas para reducir en el futuro la incidencia de ataques físicos y/o lógicos a las instalaciones del Ciclo del Agua en España?	4,8	INSUFICIENTE	FX
17	TOTAL EVALUACIÓN SEGURIDAD POR LOS EXPERTOS:	5,5	SUFICIENTE	E

Table 161: Expert assessment of Safety

Comments, suggestions, and recommendations from the experts

- It's a topic of high specialization and difficult analysis, as it depends on the objective. The risk of a physical attack is much higher than a digital one. A physical attack could lead to mass contamination, while a digital one typically results in supply interruption.
- With the expansion of digitalization and remote control, vulnerability will increase.
- Handle this concept with caution and discretion. Avoid giving ideas to potential attackers.
- Greater financial commitment to cybersecurity is necessary.
- In previous sections, the need to improve the operation and maintenance of hydraulic infrastructures has been emphasized, and this also applies to their physical and logical security.
- In the specific case of the digital realm, it's important to leverage the European Next Generation funds, under which a national PERTE (Strategic Project for Economic Recovery and Transformation) has already been launched.

5.1.7. Resilience

Peso	EVALUACIÓN DE RESILIENCIA (Encuestas a expertos) (Max 10)			
1	7.1. ¿Cómo valora la capacidad de las instalaciones del Ciclo del Agua en España para recuperar el estado de servicio inicial cuando se producen situaciones adversas?	6,4	SUFICIENTE ALTO	D
1	7.2. ¿Cómo valora las medidas adoptadas por los operadores para prevenir cortes de suministro del agua ante incidentes naturales o provocados?	6,4	SUFICIENTE ALTO	D
1	7.3. ¿Cómo evaluaría las medidas que se están adoptando en las instalaciones del Ciclo del Agua para paliar los efectos del cambio climático (por ejemplo, mayor frecuencia de fenómenos extremos como inundaciones y sequías)?	5,0	INSUFICIENTE	FX
1	7.4. ¿Cómo valora la interconexión de las redes de abastecimiento existentes a efectos de su capacidad de mantener el suministro en situaciones de destrucción o daño grave de una parte de la red?	5,4	SUFICIENTE	E
1	7.5. ¿Cómo valora los planes de contingencia que se aplican en el ciclo completo del agua para prevenir la infraestructura ante incidentes naturales o provocados?	5,7	SUFICIENTE	E
5	TOTAL EVALUACIÓN RESILIENCIA POR LOS EXPERTOS:	5,8	SUFICIENTE	E

Table 162: Expert assessment of Resilience

Comments, suggestions, and recommendations from the experts

- Contingency plans usually reflect anticipated situations. Changes resulting from climate are not well characterized (models are not precise and results fall within the range of error-average). However, given the uncertainty, it's advisable to proceed.
- Larger population size generally leads to better response.
- It's also challenging to differentiate between certain points in this section.
- It's worth mentioning that the resilience of urban systems is logically greater than that of irrigation systems. Within urban systems, larger population centers generally have better conditions than smaller ones.
- Review forecasts frequently by incorporating the latest data to reanalyze the outcomes. Analyze the cost/benefit of necessary infrastructure that will be needed within a specific timeframe.
- Undoubtedly, the ongoing climate change situation is an opportune context to conduct a comprehensive and thorough review of the resilience of all hydraulic supply systems, both surface and underground.

5.1.8. Engineering and Innovation

Peso	EVALUACIÓN DE INGENIERÍA E INNOVACIÓN (Encuestas a expertos) (Max 10)			
1	8.2. ¿Cómo valora la utilización de nuevas técnicas, tecnologías y materiales en la construcción, conservación y mantenimiento de instalaciones del Ciclo del Agua?	6,2	SUFICIENTE ALTO	D
1	8.3. ¿Cómo valora las medidas adoptadas en la licitación pública para favorecer la innovación en el sector del ciclo del agua (peso de la oferta técnica en las licitaciones, etc.)?	4,4	INSUFICIENTE	FX
1	8.4. ¿Cómo valora la adaptación del sector del regadío a las nuevas tecnologías (gestión en tiempo real, telecontrol, etc.)?	5,9	SUFICIENTE	E
1	8.5. ¿Cómo valora los programas de adaptación a las nuevas tecnologías en el caso de las estaciones de tratamiento de aguas residuales y en el campo de la reutilización de aguas?	5,6	SUFICIENTE	E
1	8.6. ¿Cómo valora la investigación, desarrollo e innovación que se está desarrollando en España con relación al ciclo completo del agua?	6,0	SUFICIENTE ALTO	D
1	8.7. ¿Cómo valora la tecnología actual que se está aplicando en el ciclo completo del agua?	6,2	SUFICIENTE ALTO	D
1	8.8. ¿Cómo valora las innovaciones en digitalización de la gestión y operaciones del ciclo completo del agua?	6,1	SUFICIENTE ALTO	D
1	8.8. ¿Cómo valora la tecnología actual que se está aplicando en la red ferroviaria?	7,5	BIEN	C
1	8.9. ¿Cómo considera el avance en la digitalización y monitorización del comportamiento de los elementos de la red ferroviaria?	7,1	BIEN	C
9	TOTAL EVALUACIÓN INGENIERÍA E INNOVACIÓN POR LOS EXPERTOS:	6,1	SUFICIENTE ALTO	D

Table 163: Expert assessment of Engineering and Innovation

Comments, suggestions, and recommendations from the experts

- Making generalizations is challenging. For example, irrigation differs greatly between the Levante region and the interior. In the Levante, there's ongoing R&D, while in the interior, it's less prominent. Investment in technology is facilitated if there's a return on investment through cost-reflective tariffs.
- Innovation is directly proportional to the size of the sample being considered.
- The issues primarily revolve around financing rather than technology and innovation.
- True technological advancements in facilities are hindered by maintaining outdated technologies due to procurement processes that impede the adoption of innovations.
- Situations vary widely depending on sectors—urban or irrigation—system size, or specific aspects considered. This leads to the coexistence of advanced remote control tools and cutting-edge desalination facilities alongside uncontrolled resource losses and insufficient engineering influence in procurement processes.
- Incorporate economic signals into water management to promote R&D.

- Implement procurement processes allowing for variations and new technologies. Employ processes based on Competitive Dialogue.
- Strengthen the role of engineering, fully develop the digitalization PERTE previously mentioned, and increase private sector involvement throughout the R&D and innovation process.

5.2. Supplementary Questionnaire

Among the questions posed to the experts, a supplementary questionnaire has been included with the following inquiries:

- **CP 1.- What infrastructure needs do you consider necessary for the Water Cycle in Spain in the next 10 years, both in a comprehensive manner and in different areas?**
 - a) Global
 - b) Regulation Works (dams and reservoirs)
 - c) Desalination Stations
 - d) High Conduits
 - e) Drinking Water Treatment Plants
 - f) Low Networks
 - g) Wastewater Treatment Stations
- **CP2.- ¿ In what approximate amount do you quantify the necessary investment to develop the infrastructure needs in the Water Cycle for the next 10 years, both globally and in different areas?**
 - a) Global
 - b) Regulation Works (dams and reservoirs)
 - c) Desalination Stations
 - d) High Conduits
 - e) Drinking Water Treatment Plants
 - f) Low Networks
 - g) Wastewater Treatment Stations

CP 1.- What infrastructure needs do you consider necessary for the Water Cycle in Spain in the next 10 years, both in a comprehensive manner and in different areas?

- a) Global**
- b) Regulation Works (dams and reservoirs)**
- c) Desalination Stations**
- d) High Conduits**
- e) Drinking Water Treatment Plants**
- f) Low Networks**
- g) Wastewater Treatment Stations**

- Wastewater treatment stations. Desalination stations. Low networks.
 - They are needed in all categories.
 - Low networks and wastewater treatment stations.
 - All those that improve efficiency, increase water security, lead to energy savings - especially through the use of renewable energy - and allow for addressing the expected reduction in natural resources by providing unconventional resources.
 - Significant investments will be needed in wastewater treatment stations to comply with the new European regulations that are coming into effect.
 - They are needed in all categories.
 - Required in c), d), and g).
 - Expansion and improvement of the sewage network.
 - Required in a) Global, transfers to deficit basins. Joint use of surface and groundwater to efficiently maintain the good status of both water bodies. Interconnection of systems to enhance resilience.
 - Required in b). Resuming necessary projects that have been discarded.
 - All of them.
 - Required in g), c), and b).
 - Required in c).
 - Regulation and desalination.
 - I do not have sufficient information to make forecasts about specific infrastructure needs, and even less to quantify the corresponding investments. I will simply dare to make the following suggestions.
1. I believe that the greatest investment effort should be made in the following areas:
 - a) Wastewater treatment
 - b) Correction of overexploitation or deficit situations, present or in the short and medium term, through sustainable infrastructure
 - c) Actions to achieve the "good status" of surface and groundwater in accordance with the Water Framework Directive
 - d) Reversible pumping to use reservoirs as renewable energy storage
 - e) Conservation and maintenance
 - f) Improvement of operation and deep digitization of systems
 2. In the case of irrigation, in addition to the above, it is also advisable:

- a) In singular critical situations of overexploitation or deficit, partial or total cancellation of irrigation authorization for the affected area may be necessary.
- b) New irrigation projects that do not guarantee water, economic, and environmental sustainability should not be authorized.
3. Although this questionnaire hardly refers to floods, it seems logical that the need to invest in flood prevention infrastructure will also be important, always in accordance with the delineation of flood-prone areas identified in Flood Risk Management Plans, elaborated in accordance with the 2007/60 Flood Directive.
4. Promote the use of advanced technologies in at least the following fields:
 - a) All types of water treatments - drinking water treatment, desalination, purification, reuse - to obtain new water and energy resources that contribute to the so-called water circular economy.
 - b) Direct use of renewable energies to meet all the needs of water systems that allow it.
 - c) Hydroelectric exploitation of all flows - in high and low conditions - that allow it.
 - d) Widespread digitization and remote control in high and low conditions.
5. In addition to all of the above, optimizing water system management indispensably requires improving water resource Governance in our country, which must include at least:
 - a) Effectively harmonize the competencies in this matter of State, Regional, and Local Administrations.
 - b) Reform the Water Administrations in a way that gives higher priority and modernizes, including digitization, their functions related to hydrological planning, public domain surveillance and control, and operation and conservation of their infrastructures.
 - c) Promote and enhance social participation in relevant government bodies and functions.
 - Required particularly in b), f), and g).
 - Required in b), e), and d).
 - In the following order: b), g), f), d), e), and finally c).
 - Required in g), d), b), f).
 - Regulation works, wastewater treatment stations, and high conditions for interconnections between basins.
 - Wastewater treatment stations, sewage collectors, and water regeneration stations.
 - Required in b) and e).
 - Regulation, interconnection, etc.

CP2.- In what approximate amount do you quantify the necessary investment to develop the infrastructure needs in the Water Cycle for the next 10 years, both globally and in different areas?

- a) Global**
- b) Regulation Works (dams and reservoirs)**
- c) Desalination Stations**
- d) High Conduits**
- e) Drinking Water Treatment Plants**
- f) Low Networks**
- g) Wastewater Treatment Stations**

- The amount of 50 billion euros has been mentioned frequently. I do not have access to specific inventories of actions, and I would not be able to assess it accurately.
- 5 billion euros.
- In principle, those indicated in the hydrological plans.
- 50 billion euros.
- 10 billion euros.

5.3. Evaluation of the Complete Water Cycle by experts

Integrating the evaluation provided by experts to the different Criteria, the overall result of the evaluation of the Complete Water Cycle by experts is as follows:

Evaluación del sector del Ciclo del agua por los expertos (Max: 10)		56		
Pesos del criterio	CRITERIOS	CALIFICACIÓN AICCP		
1	CAPACIDAD	6,4	SUFICIENTE ALTO	D

ANNEX 5

Complete Water Cycle Indicators from Key International Organizations

For the Complete Water Cycle sector, indicators from the following international organizations have been analyzed:

- OECD-International Transport Forum. <https://www.itf-oecd.org/>
- EUROSTAT.https://ec.europa.eu/info/departments/eurostat-european-statistics_es
- World Bank. <https://worldroadstatistics.org/>
- World Economic Forum <https://www.weforum.org/>
- European Commission https://ec.europa.eu/commission/index_es
- International Energy Agency <https://www.iea.org/>
- American Society of Civil Engineers. <https://www.fhwa.dot.gov/>
- Global Water Intelligence (GWI). [Home - Global Water Intelligence](#)
- European Federation of National Associations of Water Services. [EurEau - Water matters, the views of Europe's water sector](#)
- Global indicators for the Sustainable Development Goals (SDGs) and targets of the 2030 Agenda for Sustainable Development (UN). [UNSDG](#).
- Food and Agriculture Organization of the United Nations (FAO). AQUASTAT. [Libro de trabajo: Review Dashboard-v1 \(fao.org\)](#)

These international organizations, used as references, also have a complementary database that allows the creation of new quantitative indices. These selected basic data, combined with information from databases of various countries, have been the primary source of information for configuring the indicators of the Complete Water Cycle.

Below is detailed information about the assessments, indices, and indicators from the main organizations that evaluate the Complete Water Cycle:

- "Report Card for America's Infrastructure." American Society of Civil Engineers (ASCE).
- "The Global Competitiveness Report." World Economic Forum.
- "Transport in the European Union." European Commission.

1.- "Report Card for America's infrastructure." American Society of Civil Engineers (ASCE)

The "Report Card for America's Infrastructure" by ASCE (American Society of Civil Engineers) is the reference used by the Asociación Caminos for the preparation of this report. The report exclusively focuses on the scope of the United States, without conducting comparative studies with other countries or describing the specific methodology employed. The established indicators are not known, but the report provides generalized results with a rating that allows us to conclude whether the analyzed sectors of public works and services in the U.S. have improved or deteriorated compared to the previous period.

The latest edition of the "Infrastructure Report Card"¹¹ from 2021, analyzes eight criteria: capacity, physical condition, financing, future needs, operation and maintenance, public safety, resilience, and innovation.

Figure 10: Criteria analyzed in the IRC Report Card, ASCE 2021

As can be seen in the table below, the assessment system used by Asociación Caminos is similar to the ASCE¹² system.

ESPAÑA	0,0 a 2,9	3,0 a 4,9	5,0 a 5,9	6,0 a 6,9	7,0 a 7,9	8,0 a 8,9	9,0 a 10
	SUSPENSO		APROBADO		NOTABLE		SOBRESALIENTE
ECTS	FAIL	FAIL	SUFFICIENT	SATISFACTORY	GOOD	VERY GOOD	EXCELLENT
	F	FX	E	D	C	B	A
ASOCIACIÓN CAMINOS	MUY INSUFICIENTE	INSUFICIENTE	SUFICIENTE	SUFICIENTE ALTO	BIEN	MUY BIEN	EXCELENTE
	F	FX	E	D	C	B	A
INFORME ASCE	CRITICAL	FAILING	POOR		MEDIOCRE	GOOD	EXCEPTIONAL
	1 (F)	2 (F)	3 (D)		4 (C)	4 (B)	5 (A)
GPA EEUU 1	F		C B-	B	B+		A
GPA EEUU 2	F		D- D	D+ C-	C C+	B- B	B+ A- A

Table 169: Sistema de calificación del índice del sector de Asociación Caminos y su equivalencia con el sistema utilizado en este informe

The full global report can be found at: https://infrastructurereportcard.org/wp-content/uploads/2020/12/National_IRC_2021-report.pdf

¹¹ [National IRC 2021-report-2.pdf \(infrastructurereportcard.org\)](#)

¹² The ASCE system uses letters accompanied by "+" and "-" signs to indicate if it is slightly above or below the assigned letter level. To create an equivalent system, the Report of Asociación Caminos, which quantifies the state of the sector numerically on a scale of 0 to 10, allows for a correspondence with the previously published Infrastructure Report Card (IRC) reports.

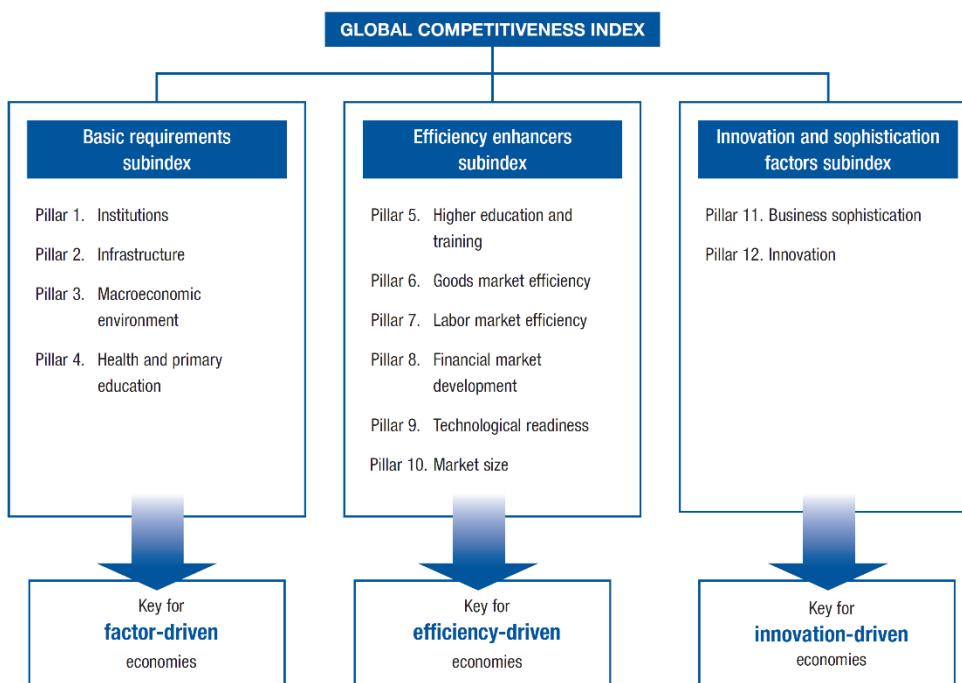

2.- "The Global Competitiveness Report". World Economic Forum

The World Economic Forum (WEF) produces a series of annual economic reports. Among them, the "Global Competitiveness Report (2019)"¹³ provides an analysis of countries with data from the year 2019, creating a list of indicators and a main index called the Global Competitiveness Index (GCI).

This global competitiveness index combines 114 components grouped into twelve policy domains or "pillars" that measure, through an indicator, three main categories or "sub-indices." Each category assesses the development of each "pillar" for the 141 participating countries.

The main categories are:

- S1: Basic Requirements
- S2: Enhancers of Efficiency
- S3: Innovation and Complexity Factors

Fuente: World Economic Forum

Figure 11: Outline of the Composition of the GCI Indicator by the WEF

Infrastructure is considered a fundamental requirement for a country's development, and it has sufficient significance to be part of one of the four pillars comprising Subindex 1 - Basic Requirements. The assessment of its indicator is carried out through nine main components based on survey ratings and objective data.

¹³ [WEF_TheGlobalCompetitivenessReport2019.pdf \(weforum.org\)](https://www.weforum.org/reports/the-global-competitiveness-report-2019/)

The calculation of the Global Competitiveness Index (GCI) is based on successive aggregations of ratings of the disaggregated indicator levels until the overall GCI is obtained. The weighting of the three main categories (subindices) depends on the development level of each country. To determine the weight of each pillar, a percentage weight is assigned to each indicator in advance, and the value of each component of the pillar is obtained from a series of surveys, adjusted with objective data to which a weight is assigned. The maximum rating is 100 and the minimum is 0.

Pillar 2: Infrastructure represents 8.3% of weight in the overall index, with the following weighting:

Pillar 2: Infrastructure.....	8.3%
A. Transport infrastructure	50%²
I. Road	25%
2.01 Quality of road network	
2.02 Quality of road infrastructure	
II. Rail	25%
2.03 Railroad density	
2.04 Efficiency of train services	
III. Air	25%
2.05 Airport connectivity	
2.06 Efficiency of air transport services	
IV. Sea.....	25%
2.07 Liner shipping connectivity ³	
2.08 Efficiency of seaport services	
B. Utility infrastructure	50%
I. Electricity	50%
2.09 Electricity access	
2.10 Electricity quality	
II. Water	50%
2.11 Exposure to unsafe drinking water	
2.12 Reliability of water supply	

Figure 12: Weighting of the Infrastructure Indicator in the 2019 GCI (Global Competitiveness Index) by the WEF (World Economic Forum)

Water accounts for 50% of the total score for public services infrastructure, with the other 50% being represented by electricity.

Spain's score in the infrastructure pillar is 90.3 out of 100, ranking seventh out of 141 countries worldwide:

2nd pillar: Infrastructure 0–100	-	90.3 ↑	7
Transport infrastructure 0–100	-	83.6 ↑	9
2.01 Road connectivity 0–100 (best)	100.0	100.0 ↑	1
2.02 Quality of road infrastructure 1–7 (best)	5.7	78.4 ↑	11
2.03 Railroad density km/1,000 km ^[12]	31.1	77.9 ↑	28
2.04 Efficiency of train services 1–7 (best)	5.4	72.9 ↓	9
2.05 Airport connectivity score	813,743.1	100.0 =	8
2.06 Efficiency of air transport services 1–7 (best)	5.6	76.9 ↑	18
2.07 Liner shipping connectivity 0–100 (best)	90.1	90.1 ↑	11
2.08 Efficiency of seaport services 1–7 (best)	5.4	73.0 ↑	16
Utility infrastructure 0–100	-	97.0 ↑	19
2.09 Electricity access % of population	100.0	100.0 =	2
2.10 Electricity supply quality % of output	9.5	94.3 ↓	56
2.11 Exposure to unsafe drinking water % of population	0.4	100.0 =	19
2.12 Reliability of water supply 1–7 (best)	6.6	93.6 ↑	16

Figure 13: Infrastructure indicators of the GCI (Global Competitiveness Index) from the WEF (World Economic Forum) in 2019

Spain's overall rating in the GCI indicator is 75%, placing it 23rd out of 141 countries:

3.- “The Global Adaptation Index (ND-Gain Indicators)”. University of Notre Dame (EE.UU.)

The Global Adaptation Index (ND-GAIN)¹⁴ by the University of Notre Dame is an open-source index that assesses a country's **vulnerability**¹⁵ to climate change and its **readiness**¹⁶ to utilize public and private sector investment for implementing adaptation actions to address climate change. The ND-GAIN index comprises over 74 variables, forming 45 basic indicators to measure the vulnerability and readiness of 192 UN member countries from 1995 to the present (due to data availability, ND-GAIN measures vulnerability for 182 countries and readiness for 184 countries).

Government agencies, multilateral organizations, NGOs, and many other entities that study the climate change adaptation measures implemented by countries use this classification and the associated indicators to evaluate countries' efforts in relation to climate change. All countries, to varying degrees, face the challenges of climate change adaptation. Some countries are more vulnerable to climate change impacts due to their geographic location or socioeconomic conditions. Additionally, certain countries are better prepared to take adaptation actions by leveraging public and private sector investments through national government policies, societal awareness, and the capacity of the private sector to engage. ND-GAIN measures both dimensions: vulnerability and readiness.

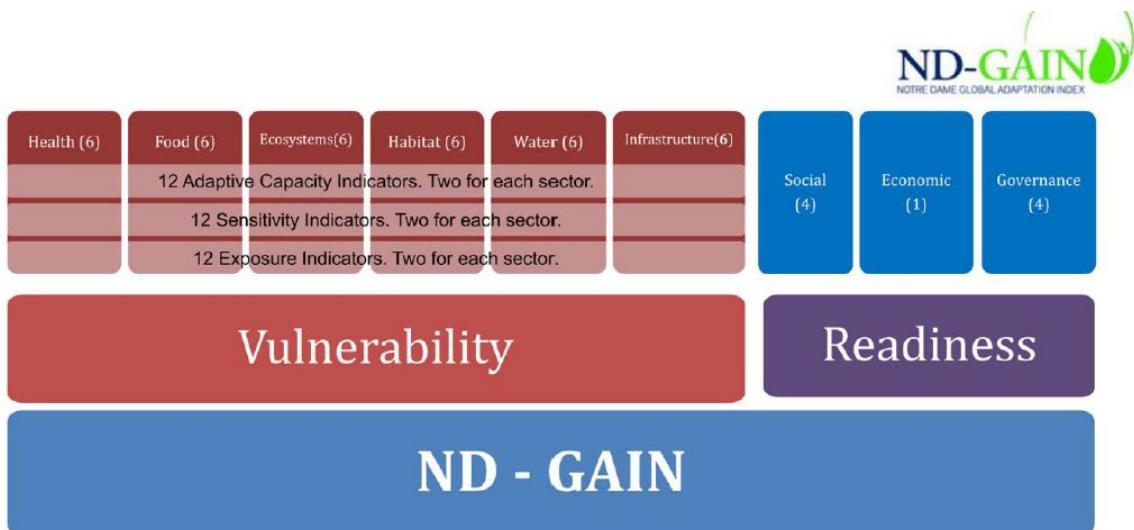

Figure 15: Summary of the vulnerability and readiness indicators from ND-GAIN

¹⁴ [Rankings // Notre Dame Global Adaptation Initiative // University of Notre Dame \(nd.edu\)](#)

¹⁵ ND-GAIN defines the concept of Vulnerability as: The propensity or predisposition of human societies to be negatively affected by climate threats.

¹⁶ ND-GAIN defines the concept of Readiness as: The willingness to make effective use of investments for adaptation actions due to a secure and efficient business and governmental environment.

The vulnerability is composed of 36 indicators grouped into three components (each component has 12 indicators) and six sectors (each sector has 6 indicators). The readiness consists of 9 indicators, grouped into three sectors.

The ND-GAIN index can be represented as a scatter plot matrix of readiness versus vulnerability.

Figure 16: Scatter plot: Vulnerability vs. Readiness by ND Gain

For assessment purposes: a higher vulnerability score indicates higher vulnerability ("worse"), a higher readiness score indicates greater readiness ("better"). Thus, vulnerability indicators are measured between 1 (lowest score) and 0 (highest score). Readiness indicators are measured between 1 (highest score) and 0 (lowest score).

The latest published ranking is from the year 2020 and shows the following results:

Rank countries by ND-GAIN Country Index, Vulnerability and Readiness.			
Scores for 2020			
Rank	Country	Income group	Score
1	Norway	Upper	75.4
2	Finland	Upper	72.0
3	Switzerland	Upper	71.9
4	Sweden	Upper	71.3
5	Denmark	Upper	71.1
6	Singapore	Upper	70.6
7	Austria	Upper	70.1
8	Germany	Upper	69.8
9	Iceland	Upper	69.8
10	New Zealand	Upper	69.7
11	United Kingdom	Upper	69.4
12	Luxembourg	Upper	68.6
13	Australia	Upper	68.5
14	Canada	Upper	67.5
15	Republic of Korea	Upper	67.2
16	France	Upper	66.9
17	Netherlands	Upper	66.6
18	United States	Upper	66.2
19	Japan	Upper	65.5
20	Slovenia	Upper	64.1
21	Ireland	Upper	64.0
22	Estonia	Upper	62.8
23	Belgium	Upper	62.7
24	Czech Republic	Upper	62.6
25	Portugal	Upper	62.2
26	Spain	Upper	61.8

Figure 17: Global ranking of the ND Gain Index for 2020

In the global ND Gain index, Spain ranks 28th with a score of 61.8 (the top country, Norway, has a score of 75.4).

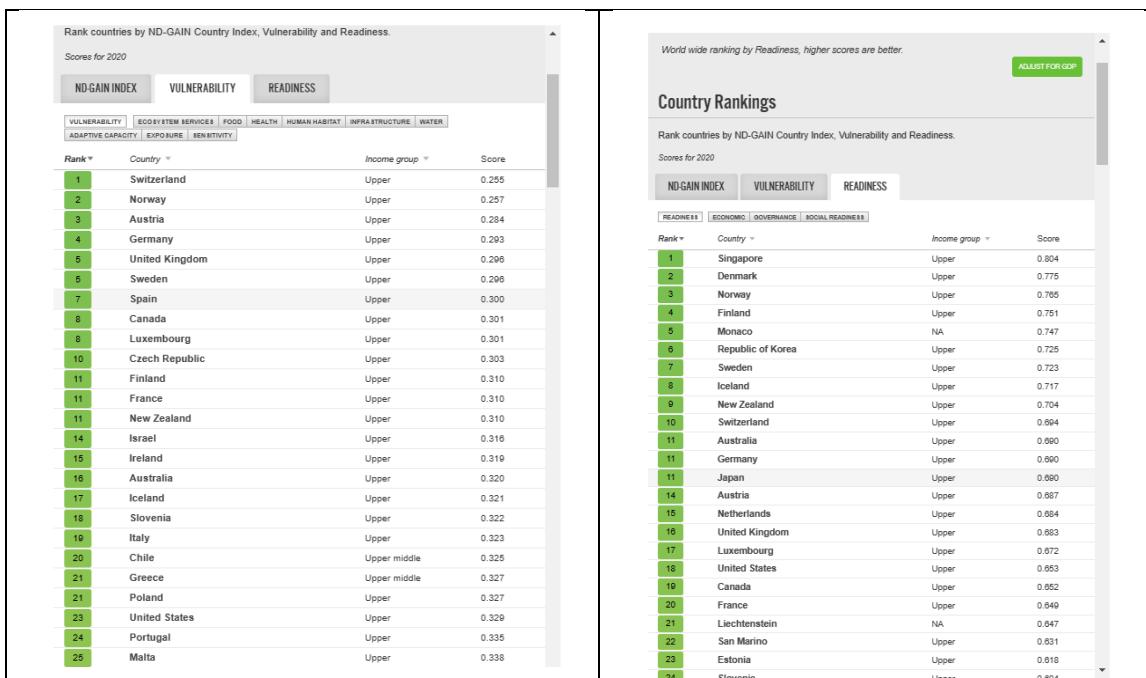

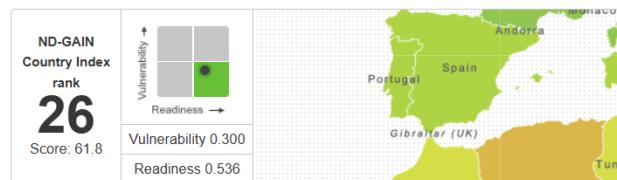

Figure 18: Ranking of Vulnerability and Preparedness in the 2020 ND Gain Index

In vulnerability, Spain ranks 7th with a score of 0.300 (the top country, Switzerland, has a score of 0.255). In preparedness, Spain scores 0.536 (the highest-scoring country is Singapore with 0.804).

The profile of Spain¹⁷ breaks down the results of all the indicators.

Spain

GDP (PPP) per capita (2020): 37,756.35 Int. Dollar Population (2020): 47,363,419 HDI (2020): 0.90

The low vulnerability score and high readiness score of Spain places it in the lower-right quadrant of the ND-GAIN Matrix. Adaptation challenges still exist, but Spain is well positioned to adapt. Spain is the 176th most vulnerable country and the 43rd most ready country.

ANNEX 6

Indicators from the main Spanish organizations for the Complete Water Cycle

In Spain, there are several key organizations that provide data on the Complete Water Cycle:

- Ministry for Ecological Transition and Demographic Challenge:
 - Water: [Agua \(miteco.gob.es\)](http://Agua.miteco.gob.es)
 - Public Bank of Environmental Indicators
 - Guide for the Development of Studies on the Physical Environment. Content and Methodology.
- Spanish Association of Water Supply and Sanitation (AEAS). Information available at: [AEAS - Asociación Española de Abastecimiento de Aguas y Saneamiento](http://AEAS-AsociaciónEspañola de Abastecimiento de Aguas y Saneamiento)
- IAGUA: Mi iAgua | iAgua
